Clark, Stephen Martin, 2018-03-27 Behavioral Neuroscience of Learning and Memory brings together the opinions and expertise of some of the world s foremost neuroscientists in the field of learning and memory research The volume provides a broad coverage of contemporary research and thinking in this field focusing both on well established topics such as the medial temporal lobe memory system as well as emerging areas of research such as the role of memory in decision making and the mechanisms of perceptual learning Key intersecting themes include the molecular and cellular mechanisms of memory formation the multiplicity of memory systems in the brain and the way in which technological innovation is driving discovery Unusually for a volume of this kind this volume brings together research from both humans and animals often relatively separate areas of discourse to give a more comprehensive and integrated view of the field The book will be of interest to both established researchers who wish to broaden their knowledge of topics outside of their specific areas of expertise and for students who need a resource to help them make sense of the vast scientific literature on this subject

Impact of Diet on Learning, Memory and Cognition Amy Claire Reichelt, Margaret J. Morris, R. Fred Westbrook, 2017-08-22

Changes in food composition and availability have contributed to the dramatic increase in obesity over the past 30-40 years in developed and increasingly in developing countries. The modern diet now contains many foods that are rich in saturated fat and refined sugar. People who eat excessive amounts of this diet are not only likely to become overweight or obese, develop metabolic and cardiovascular diseases, some forms of cancer, but also undergo a more rapid rate of normal age-related cognitive decline and more rapid progression of neurological diseases such as dementia. A central problem is why people persist in consuming this diet in spite of its adverse health effects and when alternative food choices are available. As high-fat, high-sugar foods are inherently rewarding, eating for pleasure like taking psychoactive drugs can modulate reward neurocircuitry, causing changes in responsiveness to reward, predicting stimuli, and incentive motivation. Indeed, the excessive ingestion in modern societies and the resulting obesity epidemic may be viewed as a form of food addiction. Thus, a diet high in palatable foods is proposed to impact upon reward systems in the brain, modulating appetitive learning and altering reward thresholds. Impairments in other forms of cognition have been associated with obesity, and these have a rapid onset. The hippocampus appears to be particularly vulnerable to the detrimental effects of high-fat and high-sugar diets. Recent research has shown that as little as one week of exposure to a high-fat, high-sugar diet leads to impairments in place but not object recognition memory in the rat. Excess sugar alone had similar effects, and the detrimental effects of diet consumption were linked to increased inflammatory markers in the hippocampus, a critical region involved in memory. Furthermore, obesity-related inflammatory changes have also been described in the human brain that may lead to memory impairments. These memory deficits may contribute to pathological eating behaviour through changes in the amount consumed and timing of eating. The aim of this eBook is to present up-to-date information about the impact of diet and diet-induced obesity on reward-driven learning, memory, and cognition, encompassing both animal and human literature and also potential therapeutic targets to attenuate such deficits.

Chemosensory Learning and Memory Milagros Gallo, Edmund Rolls, The contribution of research in the chemosensory field to advancing knowledge on learning and memory mechanisms has a long tradition. At the middle of the twentieth century, behavioural data provided evidence that taste and olfactory cues led to robust, long-lasting memories after single learning episodes. The peculiar features of some of these types of learning, such as conditioned taste aversion in mammals, were a challenge for learning theory at the time, which was modified in order to integrate the new findings. In the following decades, the reliability of the behavioural models favoured the application of anatomical, neurophysiological, and pharmacological techniques, prompting great progress in the identification of the specific neural circuits involved in taste and olfactory learning, thanks to the use of a variety of invertebrate and vertebrate models. In spite of the previous views that considered chemosensory learning as simple models of learning based on its phylogenetic and ontogenetic universality, at present, the systems-level approach is revealing the need to focus on the interactions between

a variety of sensory rewarding cognitive emotional and motor systems for a full understanding The great impact on the field of the more recent developments in molecular biology and human neuroimaging techniques are also remarkable Nowadays understanding the brain processes involved in learning and memory requires a wider approach to the experience dependent neural plasticity that includes new phenomena such as adult neurogenesis and epigenetics In fact research on plasticity in the olfactory system is important in both areas Moreover the realms of chemosensory learning and memory have expanded to shed light on social clinical and applied issues thus creating a wide multidisciplinary scene In this context this Research Topic is aimed to offer an updated scene of the present knowledge and questions raised in a rapidly expanding field by gathering views obtained with different species from invertebrate to humans and various techniques

Memory: Organization and Locus of Change Larry R. Squire, Norman M. Weinberger, Gary Lynch, James L. McGaugh, 1992-03-19 This book brings together an internationally respected group of researchers for the purpose of examining neuroplasticity a topic of immense current interest in psychology neuroscience neuropsychology and clinical neurology The chapters represent state of the art work on neuroplasticity at all levels behavioral neural and molecular They describe recent work on memory ranging from cellular morphological studies in invertebrates to research on the human brain made possible by new advances in neuroimaging technology The book begins with an introductory chapter that considers the psychology of memory at the global structural level The remainder of the volume is divided into three related parts The first focuses on recent approaches which are based in part on new technology that aim to measure and describe activity in relatively large populations of neurons The second focuses on memory at the level of brain systems One major theme to emerge from work at this level is that memory is composed of multiple separable components that can be identified with specific anatomical structures and connections The third part of the book focuses on molecular and cellular studies that show how individual neurons and their synapses behave

in a history dependent manner This research concerns both brief changes in synaptic plasticity as well as more lasting changes in connectivity which depend on altered gene expression and morphological growth and change Altogether the chapters provide a rich summary of the breadth and excitement of contemporary research on the biology of memory
