Optimization and Games for Controllable Markov Chains Julio B. Clempner, Alexander Poznyak, 2023-12-13 This book considers a class of ergodic finite controllable Markov chains. The main idea behind the method described in this book is to develop the original discrete optimization problems or game models in the space of randomized formulations where the variables stand in for the distributions, mixed strategies or preferences of the original discrete pure strategies in the use. The following suppositions are made: a finite state space, a limited action space, continuity of the probabilities and rewards associated with the actions, and a necessity for accessibility. These hypotheses lead to the existence of an optimal policy. The best course of action is always stationary. It is either simple, i.e., nonrandomized stationary, or composed of two nonrandomized policies, which is equivalent to randomly selecting one of two simple policies throughout each epoch by tossing a biased coin. As a bonus, the optimization procedure just has to repeatedly solve the time average dynamic programming equation, making it theoretically feasible to choose the optimum course of action under the global restriction. In the ergodic cases, the state distributions generated by the corresponding transition equations exponentially quickly converge to their stationary final values. This makes it possible to employ all widely used optimization methods such as Gradient-like procedures, Extra proximal method, Lagrange's multipliers, Tikhonov's regularization, including the related numerical techniques. In the book, we tackle different problems and theoretical Markov models like controllable and ergodic Markov chains, multi-objective Pareto front solutions, partially observable Markov chains, continuous time Markov chains, Nash equilibrium, and Stackelberg equilibrium, Lyapunov-like function in Markov chains, Best reply strategy, Bayesian incentive compatible mechanisms, Bayesian Partially Observable Markov Games, bargaining solutions for Nash and Kalai-Smorodinsky formulations, multi-traffic signal control, synchronization problem, Rubinstein's non-cooperative bargaining solutions, the transfer pricing problem, as bargaining.

LQ Dynamic Optimization and Differential Games Jacob Engwerda, 2005-06-17 Game theory is the theory of social situations and the majority of research into the topic focuses on how groups of people interact by developing formulas and algorithms to identify optimal strategies and to predict the outcome of interactions Only fifty years old it has already revolutionized economics and finance and is spreading rapidly to a wide variety of fields LQ Dynamic Optimization and Differential Games is an assessment of the state of the art in its field and the first modern book on linear quadratic game theory one of the most commonly used tools for modelling and analysing strategic decision making problems in economics and management Linear quadratic dynamic models have a long tradition in economics operations research and control engineering and the author begins by describing the one decision maker LQ dynamic optimization problem before introducing LQ differential games Covers cooperative and non cooperative scenarios and treats the standard information structures open loop and feedback Includes real life economic examples to illustrate theoretical concepts and results Presents problem formulations and sound mathematical problem analysis Includes exercises and solutions enabling use for self study or as a course text Supported by a website featuring solutions to exercises further examples and computer code for numerical examples LQ Dynamic Optimization and Differential Games offers a comprehensive introduction to the theory and practice of this extensively used class of economic models and will appeal to applied mathematicians and econometricians as well as researchers and senior undergraduate graduate students in economics mathematics engineering and management science
