Synthesis of Highway Practice National Cooperative Highway Research Program,2004 **Thomas' Register of American Manufacturers** ,2002 Major Factors Affecting the Performance of Bridges During Floods David Frederick Noble,1989 The models used to predict the depth of scour that might occur in a river when a bridge is constructed across it were based on laboratory data Within the decade of the 1980s the Federal Highway Administration encouraged the states to collect field data on flooding and its effect on bridges These data were used to verify the models for those conditions and geographic areas for which the data were applicable High water during floods is the test of such models Thus after the severe flood in November 1985 as much information as possible was collected and compiled about the flood waters the geology of the site the configuration of the river and its flood plain the bridge and the damage done by the flood at four sites Some of the data were used to calculate hydraulic parameters and depths of scour and the sediments collected were processed to determine their engineering properties At least a year after the calculations were made the Federal Highway Administration issued a technical advisory 1 on scour at bridges which contained recommendations that would have changed the results had they been available when those calculations were made It was recognized that the information collected in Virginia was limited in scope relative to the tremendous variability in characteristics and conditions that exist for rivers throughout the United States Thus in order to cooperate in a regional to national effort this information was transmitted to the Hydraulics Section of the Federal Highway Administration where it was used to verify and modify the predictive models

Reliability-based Analysis and Design of Bridge Substructure for Combination of Vessel Collision and Scour Sangyul Cho,2012 Bridges crossing waterways face potential failure risk on their piers by colliding with navigating barges and ships To decide the design vessel collision load AASHTO LRFD provides the collapse risk assessment procedure in which vessel traffic frequency waterway characteristics navigation condition and bridge load carrying capacity are incorporated

Accordingly bridge engineers are required to calculate the annual frequency of collapse by vessel collision events directly on design process which is a unique routine for practical structural design process On the streambed of inland waterways scour effect reduces the lateral load capacity on bridge substructure by lowering the bed elevation and removing the soil surrounding a foundation Accordingly a scoured bridge foundation has more likelihood of failure if it collides with a vessel The degradation of bed elevation occurs progressively due to erosion regardless of bridge existence Considered as a long term scour this type of scour has longer duration of months through years with continuous presence than a flood related short term scour Being aware of the scour effect on vessel collision resistance of bridges and the concurrence of two events AASHTO LRFD have adopted and specified a design scour depth for the vessel collision design as of long term scour depth since the recent 5th edition 2010 The factor provision was established on the basis of Turkstra s rule and engineering judgments This deterministic scour depth could result in unintended vessel collision collapse risk due to the uncertainty in predicted long term scour depth In this dissertation research by utilizing the available data and models of extreme events and the associated behavior of bridge substructure a probability based analysis of bridge substructure subjected to the combination of vessel collision and scour is developed Group pile foundations with waterline pile cap are examined for the head on vessel collision loads per different scour depth This type of bridge substructure is a common type of bridge crossing navigable waterways and has scour susceptible failure modes Failure criteria of the substructure against the combination of vessel collision and long term scour are defined as structural failure in pile section and geotechnical failure in soil Probabilistic formulation to combine the long term scour and the vessel collision is developed with consideration of the concurrence of two events the total probability theorem and the relevant set theory The independence between vessel collision and long term scour is assumed The change in the vessel collision collapse risk caused by the scour uncertainty is investigated Scour fragility concept is developed to demonstrate the influence of the scour uncertainty to the vessel collision collapse risk The current design provision pertinent to the mean scour depth equivalent to of depth may lead to unintended risk due to no consideration of the uncertainty of long term scour Especially at deeper scour depth the soil failure could be dominant and causes considerable increment of the collapse risk Accordingly a probability based provision on the long term scour is necessary for the vessel collision design process To improve the current vessel collision design procedure in AASHTO LRFD Specifications a tentative approach to obtain the design scour depth is provided Being aware of site specific property of vessel collision load and substructure capacity an immediate solution is developed An approximate approach with a few more scour depths than current deterministic one is to estimate the boundary of the collapse risk with considering the scour uncertainty This proposed method shows satisfactory estimation of vessel collision collapse risk in simplified and conservative way
