

Example 14.1. Design a suitable cross-drainage work, given the following data at the crossing of a canal and a drainage.

Canal

Full supply discharge	= 32 cumecs
Full supply level	= R.L. 213.5
Canal bed level	= R.L. 212.0 m.
Canal bed width	= 20.
Trapezoidal canal section with $1\frac{1}{2} H : 1 V$ slopes.	
Canal water depth	= 1.5 m.

Drainage

High flood discharge	= 300 cumecs.
High flood level	= 210.0 m.
High flood depth	= 2.5 m.
General ground level	= 212.5 m.

Solution. Since the drainage is of a large size, work of type III will be adopted. Further, because the canal bed level (212.0 m) is much above the H.F.L. of drainage (i.e. 210.0 m) an aqueduct will be constructed. The earthen banks of the canal will be discontinued and the canal water taken in a concrete trough. For effecting economy, the canal shall be flumed.

Step 1. Design of Drainage Waterway

Lacey's regime perimeter = $P = 4.75 \sqrt{Q}$

where Q = High flood discharge of drain
= 300 cumecs (given)

$P = 4.75 \cdot \sqrt{300} = 82.3 \text{ m.}$

Sediment Transport in Irrigation Canals Herman Depeweg, Krishna P. Paudel, Néstor Méndez V, 2014-10-06 Sediment transport in irrigation canals influences to a great extent the sustainability of an irrigation system Unwanted erosion or deposition will not only increase maintenance costs but may also lead to unfair unreliable and unequitable distribution of irrigation water to the end users Proper knowledge of the characteristics including behaviour and transport of sediment will help to design irrigation systems plan efficient and reliable water delivery schedules to have a controlled deposition of sediments to estimate and arrange maintenance activities etc The main aim of

these lecture notes is to present a detailed analysis and physical and mathematical descriptions of sediment transport in irrigation canals and to describe the mathematical model SETRIC that predicts the sediment transport deposition and entrainment rate as function of time and place for various flow conditions and sediment inputs The model is typically suited for the simulation of sediment transport under the particular conditions of non wide irrigation canals where the flow and sediment transport are strongly determined by the operation of the flow control structures The lecture notes will contribute to an improved understanding of the behaviour of sediments in irrigation canals They will also help to decide on the appropriate design of the system the water delivery plans to evaluate design alternatives and to achieve an adequate and reliable water supply to the farmers Quarterly of the Colorado School of Mines ,1912 **Colorado School of Mines**
