

The background of the cover features several stylized neurons. Each neuron has a central cell body (soma) and multiple branching processes (dendrites and axons) extending outwards. The cell bodies are rendered in a light blue or white color, while the axons are thin, light-colored lines. At the ends of many axons, there are small, glowing yellow-orange spots, representing synaptic terminals or action potentials. The neurons are scattered across the dark background, with some appearing more prominent than others. The overall effect is a scientific and artistic representation of neural activity.

Representing Development David Marco Carre, Jaan Valsiner, Stefan Hampl, 2016-07-15 Representing Development presents the different social representations that have formed the idea of development in Western thinking over the past three centuries Offering an acute perspective on the current state of developmental science and providing constructive insights into future pathways the book draws together twelve contributors with a variety of multidisciplinary and international perspectives to focus upon development in fields including biology psychology and sociology Chapters and commentaries in this volume present a variety of perspectives surrounding social representation and development addressing

their contemporary enactments and reflecting on future theoretical and empirical directions The first section of the book provides an historical account of early representations of development that having come from life science has shaped the way in which developmental science has approached development Section two focuses upon the contemporary issues of developmental psychology neuroscience and developmental science at large The final section offers a series of commentaries pointing to the questions opened by the previous chapters looking to outline the future lines of developmental thinking This book will be of particular interest to child psychologists educational psychologists and sociologists or historians of science as well as academics and students interested in developmental and life sciences

Building Brains David J. Price, Andrew P. Jarman, John O. Mason, Peter C. Kind, 2011-05-16 The development of a brain from its simple beginnings in the embryo to the extraordinarily complex fully functional adult structure is a truly remarkable process Understanding how it occurs remains a formidable challenge despite enormous advances over the last century and current intense world wide scientific research A greater knowledge of how nervous systems construct themselves will bring huge benefits for human health and future technologies Unravelling the mechanisms that lead to the development of healthy brains should help scientists tackle currently incurable diseases of the nervous system such as autism epilepsy and schizophrenia to name but a few discover more about the processes that cause the uncontrolled growth associated with cancer and develop possible treatments Building Brains provides a highly visual and readily accessible introduction to the main events that occur during neural development and the mechanisms by which they occur Aimed at undergraduate students and postgraduates new to the field who may not have a background in neuroscience and or molecular genetics it explains how cells in the early embryo first become neural how their proliferation is controlled what regulates the types of neural cells they become how neurons connect to each other how these connections are later refined under the influence of neural activity including that arising from experience and why some neurons normally die Key Features A concise illustrated guide focusing on the core elements of current understanding of neural development emphasising common principles underlying developmental mechanisms and supplemented by suggestions for further reading Text boxes throughout provide further detail on selected major advances issues of particular uncertainty or controversy and examples of human diseases that result from abnormal development A balanced mammalian non mammalian perspective drawing on examples from model organisms including the fruit fly nematode worm frog zebrafish chick mouse ferret cat monkey and human and emphasising mechanisms that are conserved across species Introduces the methods for studying neural development including genetics transgenic technologies advanced microscopy and computational modeling allowing the reader to understand the main evidence underlying research advances Student friendly full colour artwork reinforces important concepts an extensive glossary and definitions in page margins help readers from different backgrounds chapter summaries stress important points and aid revision Associated Website includes a complete set of figures from the textbook

Developmental Cognitive Neuroscience: An Introduction Mark Johnson,1997-01-01 Developmental cognitive neuroscience is concerned with the relation between the growing brain and the development of mental processes Bringing together recent advances in molecular biology neural networks and brain imaging this interdisciplinary field is rapidly expanding and offers a cohesive account of the construction of the human mind This book is the first comprehensive single authored introduction to the field and reviews the current state of knowledge in the context of an integrative theoretical framework within which the plasticity and maturation of the brain are analysed A central theme of the book is that while there is no evidence of innate cognitive representations in the cortex the type and location of representation that subsequently emerge are constrained by several factors both intrinsic and extrinsic to the infant Further the elongated postnatal development of the human brain reveals a differential development of neural architecture that can be used to make predictions about sequences of cognitive development The book also outlines a number of avenues for future research
The Psychologist ,2006 Developmental Neurobiology Greg Lemke,2010-05-22 Developmental Neuroscience is one of the six core disciplines in Neuroscience and yet no single volume non textbook reference exists on the market that provides researchers with more in depth high level information on developmental neurobiology Currently anyone interested in the field at a higher level must sift through review articles published frequently and the more specific handbooks that focus on aspects of development rather than the field as a whole This reference is the first of its kind to fill this need It pulls together the relevant articles on the topic from the 10 volume Encyclopedia of Neuroscience Academic Press 2008 and serves as an affordable and immediate resource for scientists postdocs graduate students with an interest beyond the basic textbook materials on the subject The first and only comprehensive single volume reference for developmental neuroscience that goes beyond the basic textbook information The 93 chapters cover topics ranging from cell fate determination path finding synapse generation neural stem cells to neurodegeneration and regeneration carefully selected from the Encyclopedia of Neuroscience by one of the great developmental neuroscientists Greg Lemke The best researchers in the field provide their conclusions in the context of the latest experimental results **Southern Illinois University Law Journal** Southern Illinois University at Carbondale.
