

🔥 Advanced Diesel Generator Interview Question & Answer 🔥

Q: What is the function of a droop setting in a diesel generator?

A: The droop setting controls the generator's frequency and power sharing when multiple generators run in parallel. It adjusts the fuel supply based on load demand, ensuring stable operation and preventing overloading.

Q: What is black smoke in a diesel generator exhaust, and how do you fix it?

A: Black smoke indicates incomplete combustion due to clogged air filters, faulty injectors, or incorrect fuel-air mixture. Fix it by cleaning/replacing air filters, checking fuel injectors, and ensuring proper turbocharger function.

Q: What is the significance of the AVR (Automatic Voltage Regulator) in a generator?

A: AVR maintains a steady voltage output by adjusting the excitation current to the alternator, preventing voltage fluctuations that could damage electrical equipment.

Q: How does a diesel generator synchronize with the grid or another generator?

A: Synchronization requires matching voltage, frequency, phase sequence, and phase angle. This is done using a synchronizer and breaker system to ensure a smooth transition without power surges.

Q: What happens if a generator runs with a leading power factor?

A: A leading power factor can cause voltage instability and may lead to AVR malfunction or overexcitation, potentially damaging the alternator.
