

Difference between serial and parallel processing

This slide shows the comparison between serial and parallel processing based on factors such as cost, processor heat, time to complete a task, data transfer rate, and so on. In serial processing, there is only one CPU to complete a task, whereas parallel processing comprises multiple CPUs.

- Same tasks are performed simultaneously in serial processing, whereas completion times might differ in parallel processing
- Data transfers in bit by bit form in serial processing, whereas data transfers in byte form, i.e., in 8 bits form in parallel processing
- Burden on the single-core CPU is substantial during sequential processing, and the processor warms up rapidly
- In comparison to serial processors, parallel processors are more expensive
