Three Theories of the Solar System

Three Theories of the Solar System

Three theories (geocentric, heliocentric, and tidal) try to describe how the solar system formed.

In the geocentric theory, the Earth is at the center of the solar system. The sun, planets, and moons orbit around the Earth. This theory was developed by ancient Greek astronomer Ptolemy in the 2nd century AD.

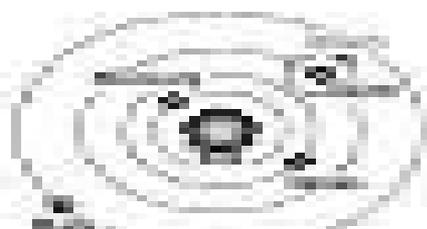

During the 16th century, Copernicus proposed a heliocentric theory. He believed that the sun is at the center of the solar system, and the planets, including Earth, orbit around it. This theory was supported by Galileo's observations of the moons of Jupiter and the phases of Venus. In the 17th century, Newton's theory of gravity provided a mathematical explanation for the heliocentric model.

In the tidal theory, proposed by Laplace in 1796, the solar system formed from a rotating cloud of gas and dust. As the cloud collapsed, it flattened into a disk. The sun formed at the center, and the planets formed from the material in the disk.

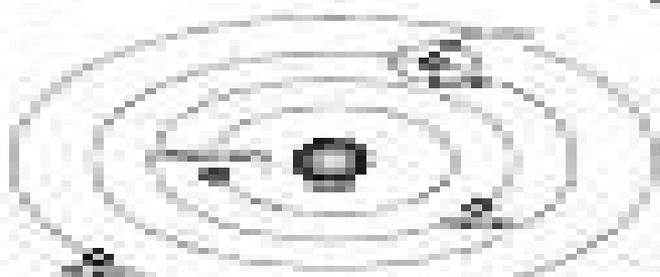

The tidal theory was supported by Laplace's calculations of the orbits of the planets. However, it was later found that the tidal theory could not explain the angular momentum of the solar system. The current theory of the formation of the solar system is the nebular theory, which is based on the tidal theory but includes the concept of a protoplanetary disk.
