Deep Anode Systems T. H. Lewis,2000 **Recommended Practice for Corrosion Management of Pipelines in Oil & Gas Production and Transportation** Bijan Kermani,2017-12-02 First Published in 2017 Pipeline integrity is key to maintaining operational success safety and security and minimising harm to the environment Corrosion is a dominant contributory factor to failures leaks and integrity threats in pipelines Therefore its optimum control within an integrity management framework is paramount for the cost effective design of facilities and ensuring continued uninterrupted and safe operations within the expected design life This recommended practice RP is a compendium of current best practices and state of the art knowledge by major operators engineering contractors and service companies involved in hydrocarbon production and transportation The RP incorporates some minimum operational requirements and practices to ensure that when man aging corrosion in pipelines fundamental principles are followed It covers management of corrosion for pipelines carrying hydrocarbons injection water and or produced water from design to decommissioning It is structured to follow the logical steps of a basic corrosion management process and makes references to relevant and available international standards and or recommended practices It is intended for use by personnel from the petroleum industry having knowledge of corrosion and materials It is hoped that this RP will prove to be a key reference document for engineers suppliers and contractors working in the oil and gas industry paving the way for corrosion free operation of pipelines with the ultimate goal of improving safety security and minimising the impact on the environment External Corrosion and Corrosion Control of Buried Water Mains Andrew E. Romer,2004 Water utilities often do not know the specific cause of external corrosion observed on their water mains and consequently the chosen preventative measure may not work effectively Historically these choices are based on data from other industries e g gas and oil and may not be suitable for the water industry Corrosion of metallic pipes can be caused by a variety of mechanisms each of which requires a different solution Determining which corrosion mechanism is at work is not a simple matter because the resulting pipe damage looks similar for all of them The failure to properly identify corrosion sources may produce prevention systems that are ineffective or do not last For example it is not effective to install an anode bag on a main that has a bacteriological corrosion problem Similarly an anode bag installed to reduce corrosion caused by a stray impressed current would be quickly used up and would provide only short term protection Much recent research on corrosion has focused on internal corrosion primarily related to water quality issues such as lead and copper control and red water This project will examine external corrosion which affects the structural integrity of the pipe and makes it vulnerable to leaks and breakage After identifying the causes of external corrosion the study will find economical solutions for each type of corrosion and verify them through field trials **Corrosion Tests and Standards** Robert Baboian,2005 **An Introduction to Engineering Construction of Cathodic Protection Systems** J.
