The Parts of Lungs

The respiratory system is made up of

- Trachea
- Bronchi (Main)
- Bronchioles (Small)
- Alveoli (Tiny sacs where gas exchange happens)

Right and Left Lungs

Each lung has a main bronchus which air enters the body. The right lung is larger and has a central sulcus.

The central sulcus is made up of the main bronchus - front and back cartilage.

Major vessels - the pulmonary artery and vein.

Air is inhaled or exhaled by moving the diaphragm and rib cage.

Diaphragm contracts and relaxes to allow air to enter and leave the lungs.

The diaphragm is a muscle that separates the chest from the abdomen.

The Bronchi

The bronchi are the main airways that carry air into and out of the lungs. They are located in the chest cavity.

The bronchi are made up of cartilage and muscle. The cartilage keeps the airways open.

The bronchi branch out into smaller airways called bronchioles.

The bronchioles end in small sacs called alveoli.

The alveoli are where gas exchange happens.

The alveoli are surrounded by a network of blood vessels.

The blood vessels carry oxygenated and deoxygenated blood.

The mechanics of respiration involve the contraction and relaxation of the diaphragm and the rib cage. This is dependent on the structure of the lungs and the elasticity of the chest wall.

Inhalation

During inhalation, the diaphragm contracts and moves down, increasing the volume of the chest cavity.

This causes the pressure inside the chest to decrease, and air is drawn in.

The rib cage also expands outwards, further increasing the volume of the chest cavity.

As the volume increases, the pressure inside decreases, resulting in negative pressure.

Since the pressure inside is lower than atmospheric pressure, air is drawn in.

Exhalation is the opposite process. The diaphragm relaxes and moves up, decreasing the volume of the chest cavity.

This causes the pressure inside to increase, and air is forced out.

The rib cage also contracts, further decreasing the volume of the chest cavity.

As the volume decreases, the pressure inside increases, resulting in positive pressure.

Since the pressure inside is higher than atmospheric pressure, air is forced out.
