**Reactions in Electrical Discharges** N. S. Pechuro,2013-11-11 Recently interest has arisen in the use of electrical discharges to effect chemical reactions Various types of discharges enable us to alter the conditions of a process over a wide range and often to combine the high electron temperatures necessary to activate certain reactions with the low molecular temperatures of the medium used This makes it possible to simplify the techniques and apparatus required for a process and to quench the products thus preventing them from decomposing again Same work on the use of electrical discharges has already found practical applications These include the preparation of oxides of nitrogen hydrocyanic acid ozone and hydrogen peroxide thickening of oils synthesis of acetylene and its homologs hydrogenation and dehydrogenation of various oils and animal fats etc In the heavy organic synthesis industry lower olefins and acetylenes are used on a large scale as raw materials for producing many valuable products Methods of producing ethylene propylene and butylenes from gaseous and liquid hydrocarbon feedstocks have been widely adopted However the production of acetylene which is an important and sometimes indispensable initial product is mainly based on calcium carbide Despite a number of recent improvements this method of acetylene production suffers from high electric power consumption and expensive raw materials requires several stages and produces large amounts of waste products Various lines are being followed in the attempt to find new more sophisticated means of producing acetylene     **eBook Automotive Mechanics, Revised Edition** MAY,
