**New Technical Indicators in Python** Sofien Kaabar,2021-02-18 What is this book all about This book is a modest attempt at presenting a more modern version of Technical Analysis based on objective measures rather than subjective ones A sizeable chunk of this beautiful type of analysis revolves around technical indicators which is exactly the purpose of this book I believe it is time to be creative and invent our own indicators that fit our profiles Having had more success with custom indicators than conventional ones I have decided to share my findings The following chapters present new indicators that are the fruit of my research as well as indicators created by brilliant people I also include the functions to create the indicators in Python and provide how to best use them as well as back testing results What am I going to gain You will gain exposure to many new indicators and concepts that will change the way you think about trading and you will find yourself busy experimenting and choosing the strategy that suits you the best How is it organized The order of chapters is not important although reading the introductory technical chapter is helpful The book is divided into three parts part 1 deals with trend following indicators part 2 deals with contrarian indicators part 3 deals with market timing indicators and finally part 4 deals with risk and performance indicators What do you mean when you say this book is dynamic and not static This means that everything inside gets updated regularly with new material on my Medium profile I always publish new findings and strategies Make sure to follow me What level of knowledge do I need to follow this book Although a basic or a good understanding of trading and coding is considered very helpful it is not necessary At the beginning of the book I have included a chapter that deals with some Python concepts but this book is not about Python

especially in the stock market forecasting the trend or the price of stocks using machine learning techniques and artificial neural networks are the most attractive issue to be investigated As Giles explained financial forecasting is an instance of signal processing problem which is difficult because of high noise small sample size non stationary and non linearity The noisy characteristics mean the incomplete information gap between past stock trading price and volume with a future price The stock market is sensitive with the political and macroeconomic environment However these two kinds of information are too complex and unstable to gather The above information that cannot be included in features are considered as noise The sample size of financial data is determined by real world transaction records On one hand a larger sample size refers a longer period of transaction records on the other hand large sample size increases the uncertainty of financial environment during the 2 sample period In this project we use stock data instead of daily data in order to reduce the probability of uncertain noise and relatively increase the sample size within a certain period of time By non stationarity one means that the distribution of stock data is various during time changing Non linearity implies that feature correlation of different individual stocks is various Efficient Market Hypothesis was developed by Burton G Malkiel in 1991 *Quantitative Trading Strategies Using Python* Peng Liu,2023 Build and implement trading strategies using Python This book will introduce you to the fundamental concepts of quantitative trading and shows how to use Python and popular libraries to build trading models and strategies from scratch It covers practical trading strategies coupled with step by step implementations that touch upon a wide range of topics including data analysis and visualization algorithmic trading backtesting risk management optimization and machine learning all coupled with practical examples in Python Part one of *Quantitative Trading Strategies with Python* covers the fundamentals of trading strategies including an introduction to quantitative trading the electronic market risk and return and forward and futures contracts Part II introduces common trading strategies including trend following momentum trading and evaluation process via backtesting Part III covers more advanced topics including statistical arbitrage using hypothesis testing optimizing trading parameters using Bayesian optimization and generating trading signals using a machine learning approach Whether you re an experienced trader looking to automate your trading strategies or a beginner interested in learning quantitative trading this book will be a valuable resource Written in a clear and concise style that makes complex topics easy to understand and chock full of examples and exercises to help reinforce the key concepts you ll come away from it with a firm understanding of core trading strategies and how to use Python to implement them You will Master the fundamental concepts of quantitative trading Use Python and its popular libraries to build trading models and strategies from scratch Perform data analysis and visualization algorithmic trading backtesting risk management optimization and machine learning for trading strategies using Python Utilize common trading strategies such as trend following momentum trading and pairs trading Evaluate different quantitative trading strategies by applying the relevant performance measures and statistics in a scientific manner during backtesting **Programming with Python** Tim
