Question 1:

[12 Marks]

Suppose that data (of a screen saver) of 2000 words of display memory is placed on stack with the last word of display memory (i.e. word at 0xB800:3998) placed at the bottom of the stack. You need to display this data on screen and after each second slide it by  $n$  characters towards left starting from the bottom of the screen. Initially the value of  $n$  is 2 (i.e. you need to slide each character towards its left by  $n$  units), after another second passes by, this value will be 4 (previous value of  $n * 2$ ), after yet another second it will be 8 (previous value of  $n * 2$ ). This will continue till the whole screen data will be rubbed off. Use white foreground to rub data.

Use *string* instructions only to dump and slide data on display screen. No credit will be given without string instructions. Note that you are not required to scroll up rows here neither you are required to slide all rows simultaneously towards their left. You are required to slide characters towards left starting from bottom right corner of screen sliding (smoking) its way up to top left corner.

Let's say initially data dumped on screen is like this. Note the bold alphabets to understand how sliding is going on.

Initial Data:
