The Coastlines of the World with Google Earth Anja M. Scheffers, Sander R. Scheffers, Dieter H. Kelletat, 2012-03-06

Far away shores, exotic islands, or adventurous sea voyages, coasts are the destination of dreams for millions of people around the globe. Large numbers of people also call coasts their home. In many countries, a narrow coastal strip is densely populated, making these places vulnerable to marine natural hazards such as storms or tsunamis. The book *Coastlines of the World with Google Earth* aims to draw people's attention within and outside of the science community towards coastal sciences and spark interest for the extraordinary diversity and beauty of coastal environments. The book illustrates the fascinating variety of coastal landscapes using images from Google Earth's virtual globe that allow us to explore the world and demonstrate knowledge and applications of coastal science in many different fields in an engaging visual tour. The book of Anja and Sander Scheffers and Dieter Kelletat is a true cornucopia for everyone, both scientists and laymen interested in coastal geomorphology. On the one hand, it documents the enormous significance of Google Earth for coastal science issues and shows how powerful this tool is for visualizing coastal features and processes. On the other hand, the reader gets a vivid insight into the many varieties of coastal science and its applications. This is especially true with regard to coastal hazards such as extreme events and global sea level rise, knowing that the vulnerability of coastal zones has dramatically increased during the past decades. The fact that the book is so attractive and inspiring to both beginners and experts is also due to the huge experience that the authors have gained during their manifold research activities.
