

Figure 2. Overview of the DDNN architecture. The vertical lines represent the DNN pipeline, which connects the horizontal bars (NN layers). (a) is the standard DNN (processed entirely in the cloud), (b) introduces end devices and a local exit point that may classify samples before the cloud, (c) extends (b) by adding multiple end devices which are aggregated together for classification, (d) and (e) extend (b) and (c) by adding edge layers between the cloud and end devices, and (f) shows how the edge can also be distributed like the end devices.

Towards Design and Development of Secure and Privacy-Preserving Frameworks for IoT-enabled Networks Prabhat Kumar,2022-04-11 Doctoral Thesis Dissertation from the year 2022 in the subject

Computer Sciences Internet of Things IOT grade First course PhD language English abstract With the advancement of low cost and low energy consuming sensors the Internet of Things IoT is building a network of Internet enabled devices The concept of IoT is employed in almost all fields such as healthcare smart cities smart grids energy distribution agriculture and even transportation In a typical IoT enabled network smart sensors are geographically distributed to collect and process data within a smart infrastructure using an open channel the Internet However the use of the Internet brings inherent vulnerabilities related to security e g IoT devices can be compromised using advanced hacking techniques and privacy e g adversary performing inference and data poisoning attacks Intrusion Detection System IDS and Cyber Threat Intelligence CTI are the two most extensively used techniques in IoT enabled networks to safeguard the integrity and availability of sensitive smart systems However the presence of a large volume of data i e dimensionality curse and cloud based centralized deployment mechanism hurts the IDS performance in terms of intrusion detection tasks and increased latency for data processing On the other hand modelling CTI is challenging due to the limited labels of cyber threat sources and analysing these sources to extract relevant threat information manually is a time consuming and error prone procedure that necessitates a large investment of resources This thesis provides substantial contributions to research on the building of a distributed IDS a hybrid feature selection approach an automated CTI Modelling and Identification scheme and a deep privacy encoding module for enhancing security and privacy of IoT enabled networks

*Distributing Deep Neural Network Inference Across Edge-hub-cloud Systems* Robert Steven Viramontes, 2025 Deep neural networks DNNs have been instrumental in the recent rapid growth of artificial intelligence DNNs have grown in compute complexity and

requirements as they have advanced to achieve greater accuracy across a variety of domains As these DNNs have been growing they have also found use in a variety of applications that may be for instance latency or energy constrained This work explores distributed inference across multiple heterogeneous devices as a method to meet optimization objectives That is each layer of the DNN is assigned to be computed on a particular device to e g minimize latency The distributed inference problem is modeled as a flexible and extensible integer linear program ILP We then explore a variety of novel distributed inference approaches by extending this model showing that these approaches improve objectives such as latency or energy compared to prior work We first model a technique to reduce overall latency called weight preloading taking advantage of opportunities to overlap compute and data movement Then based upon our observations during profiling we introduce a novel constraint to ensure correct layer assignments and demonstrate a new technique for reducing profiling effort We also demonstrate that device operating frequency may be used as a knob of control alongside layer assignment to trade off latency and energy during distributed inference Finally the model is extended to minimize carbon footprint over an application duration demonstrating that distributed inference can be utilized to reduce environmental impact This work demonstrates that distributed inference as modeled by our ILP formulations can effectively address a variety of application objectives
