

**TEST 2: PREFERENTIAL PREDATION (PREDATORS PREFER YELLOW FISH)**

In this round, the predators discover that the blue allele made a sour-tasting protein. Since both blue and green fish have the blue allele, both color fish taste sour to the predators. As a result, the predators prefer yellow fish.

Again, the initial round is a control and you should randomly pull straws out of the bag in pairs to produce your fish. No fish are eaten in this control round. For the remaining three generations in this round, the predators will eat every other yellow fish (half of the yellow fish) and those alleles will be removed from the population — not passing on to the next generation. Between generations within the round, return only the surviving fish to the bag. After each generation, record the results for fish colors and the numbers of surviving alleles.

Generation #	Colors of surviving fish				Surviving alleles		
	Blue	Green	Yellow	Total fish	Blue	Yellow	Total alleles
1 control (No predation)				20	20	20	40
2				18	19	17	36
3				16	17	16	34
4				15	18	12	30
