Architecture of Computing Systems Dietmar Fey, Benno Stabernack, Stefan Lankes, Mathias Pacher, Thilo Pionteck, 2024-08-01 This book constitutes the proceedings of the 37th International Conference on Architecture of Computing Systems ARCS 2024 held in Potsdam Germany in May 2024 The 23 papers presented in this volume were carefully reviewed and selected from 33 submissions These papers have been categorized in the following sections Progress in Neural Networks Organic Computing Computer Architecture Co Design Progress in HPC Computer Architectures and Dependability and Fault Tolerance *Reliable Software Technologies - Ada-Europe 2002* Johann Blieberger, Alfred Strohmeier, 2003-08-02 This book constitutes the refereed proceedings of the 7th International Conference on Reliable Software Technologies Ada Europe 2002 held in Vienna Austria in June 2002 The 24 revised full papers presented together with four invited papers were carefully reviewed and selected for inclusion in the proceedings The papers are organized in topical sections on embedded systems case studies real time systems high integrity systems Ada language issues program analysis tools distributed systems and libraries and APIs **Embedded Systems Programming**, 1998-07 **ACM SIGPLAN Notices**, 2006-07 **CODES+ISSS**, 2005 **ACM Transactions on Programming Languages and Systems** Association for Computing Machinery, 2005 Contains articles on programming languages and their semantics programming systems storage allocations and garbage collection languages and methods for writing specifications testing and verification methods and algorithms specifically related to the implementation of language processors Advanced Memory Optimization Techniques for Low-Power Embedded Processors Manish Verma, Peter Marwedel, 2007-06-20 In a relatively short span of time computers have evolved from huge mainframes to small and elegant desktop computers and now to low power ultra portable handheld devices With each passing generation computers consisting of processors memories and peripherals became smaller and faster For example the rst commercial computer UNIVAC I costed 1 million dollars occupied 943 cubic feet space and could perform 1 905 operations per second 94 Now a processor present in an electric shaver easily outperforms the early mainframe computers The miniaturization is largely due to the efforts of engineers and

scientists that made the expeditious progress in the microelectronic technologies possible According to Moore's Law 90 the advances in technology allow us to double the number of transistors on a single silicon chip every 18 months This has led to an exponential increase in the number of transistors on a chip from 2 300 in an Intel 4004 to 42 millions in Intel Itanium processor 55 Moore's Law has withstood for 40 years and is predicted to remain valid for at least another decade 91 Not only the miniaturization and dramatic performance improvement but also the significant drop in the price of processors has led to a situation where they are being integrated into products such as cars televisions and phones which are not usually associated with computers This new trend has also been called the disappearing computer where the computer does not actually disappear but it is everywhere 85 Digital devices containing processors now constitute a major part of our daily lives A small list of such devices includes microwave ovens television sets mobile phones digital cameras MP3 players and cars Whenever a system comprises of information processing digital devices to control or to augment its functionality such as a system or embedded system Therefore all the above listed devices can be also classified as embedded systems

complex intellectual property components or cores many of which are programmable processors Traditionally these embedded processors mostly have been programmed in assembly languages due to efficiency reasons This implies time consuming programming extensive debugging and low code portability The requirements of short time to market and dependability of embedded systems are obviously much better met by using high level language e g C compilers instead of assembly However the use of C compilers frequently incurs a code quality overhead as compared to manually written assembly programs Due to the need for efficient embedded systems this overhead must be very low in order to make compilers useful in practice In turn this requires new compiler techniques that take the specific constraints in embedded system design into account An example are the specialized architectures of recent DSP and multimedia processors which are not yet sufficiently exploited by existing compilers
