**Code Structure**

```

var ...
//Global variable declarations
function funcA([param1,param2,...])
{
var ...
//Local variable declarations - visible in nested functions

function innerFuncA([param1,param2,...])
{
var ...
//Variable local to innerFuncA
//your code here
}

//Name="ExplainThat!";
//global global variable creation
//your code here
}
    
```

**Nomenclature Rules**

Function and variable names can consist of any alphanumeric character (0-9) and are allowed. The first character cannot be numeric. Many standard ASCII characters are allowed. There is no practical limit on name length. Names are case-sensitive.

If two or more variables or functions or a variable & a function are declared with the same name, the last declaration obliterates all previous ones. Using a keyword as a variable or function name obliterates that keyword.

**Visibility & Scope**

Assignments without the use of the var keyword result in a new global variable of that name being created.

Variables declared with the var keyword outside the body of a function are global. Variables declared with the var keyword inside the body of a function are local to that function. Local variables are visible to all nested functions.

Local entities hide globals bearing the same name.

**Variable Types**

**string:** var s = "explainthat" or "explainthat"  
**number:** var n = 3.14159, 100, 0, ...  
**Boolean:** var flag = false or true  
**object:** var d = new Date();  
**function:** var greet = function sayHello() {alert("hello");}  
 JavaScript is a weakly typed language - i.e. a simple assignment is sufficient to change the variable type. The typed keyword can be used to check the current variable type.

**Special Values**

The special values false, infinity, NaN, null, true & undefined are recognized. null is an object. Infinity and NaN are numbers.

**Operators**
