*Wearable Sensor Technology for Monitoring Training Load and Health in the Athletic Population* Billy

Sperlich, Hans-Christer Holmberg, Kamiar Aminian, 2020-02-13 Several internal and external factors have been identified to estimate and control the psycho biological stress of training in order to optimize training responses and to avoid fatigue overtraining and other undesirable health effects of an athlete An increasing number of lightweight sensor based wearable technologies wearables have entered the sports technology market Non invasive sensor based wearable technologies could transmit physical physiological and biological data to computing platform and may provide through human machine interaction smart watch smartphone tablet bio feedback of various parameters for training load management and health However in theory several wearable technologies may assist to control training load but the assessment of accuracy reliability validity usability and practical relevance of new upcoming technologies for the management of training load is paramount for optimal adaptation and health XIII Mediterranean Conference on Medical and Biological Engineering and Computing 2013 Laura M. Roa Romero, 2013-10-01 The general theme of MEDICON 2013 is Research and Development of Technology for Sustainable Healthcare This decade is being characterized by the appearance and use of emergent technologies under development This situation has produced a tremendous impact on Medicine and Biology from which it is expected an unparalleled evolution in these disciplines towards novel concept and practices The consequence will be a significant improvement in health care and well fare i e the shift from a reactive medicine to a preventive medicine This shift implies that the citizen will play an important role in the healthcare delivery process what requires a comprehensive and personalized assistance In this context society will meet emerging media incorporated to all objects capable of providing a seamless adaptive anticipatory unobtrusive and pervasive assistance The challenge will be to remove current barriers related to the lack of knowledge required to produce new opportunities for all the society while new paradigms are created for this inclusive society to be socially and economically sustainable and respectful with the environment In this way these proceedings focus on the convergence of biomedical engineering topics ranging from formalized theory through experimental science and technological development to practical clinical applications **Exercise and Sport: Their Influences on**

**From Narrow Straits to Broad Horizons of Aortic Stenosis** Henric Nilsson,2026-02-03 Background and aims Aortic stenosis AS is the most common valve disease in Europe It is associated with adverse myocardial remodelling and impaired exercise capacity reflecting limited ability to increase cardiac output during physical exertion Resting measures of AS do not fully capture functional limitations and despite practical recommendations cardiopulmonary exercise testing CPET remains underused in this patient population In patients with severe AS important knowledge gaps remain regarding how circulating

biomarkers reflect structural myocardial remodelling how exercise capacity and systolic blood pressure SBP change before and after surgical aortic valve replacement AVR and how structured postoperative exercise training influences functional recovery This thesis aimed to improve pre and postoperative evaluation of patients with severe AS by exploring exercise physiology methods focusing on CPET and circulating biomarkers Methods Four studies were conducted within two prospective cohorts of patients with severe AS referred for AVR at a tertiary centre in Sweden In paper I associations between circulating biomarkers and diffuse myocardial fibrosis assessed by myocardial biopsies and by imaging were explored In paper II maximal and submaximal CPET variables were evaluated before and one year after AVR surgery In paper III SBP responses during incremental CPET were analyzed before and after AVR including categorization of SBP responses and work load indexed SBP slopes In paper IV a randomized controlled trial assessed the effect of a 12 week aerobic exercise training intervention compared to usual care on CPET derived functional outcomes following AVR Results In Paper I n 36 circulating biomarkers showed distinct associations with DMF assessed by cardiac magnetic resonance imaging CMR and histopathology Biomarkers related to extracellular matrix turnover Galectin 3 MMP 2 and myocardial stress Troponin I NT proBNP were most strongly linked to CMR derived measures T1 time extracellular volume while NT proBNP correlated with biopsy derived collagen volume fraction These findings indicate that biochemical markers reflect complementary aspects of myocardial remodelling In paper II n 30 maximal exercise capacity was relatively preserved preoperatively mean peak VO<sub>2</sub> 95% of predicted One year after AVR maximal workload increased modestly 8% peak VO<sub>2</sub> showed no significant group level change and submaximal aerobic capacity VO<sub>2</sub> at ventilatory threshold increased significantly 9% Improvements in peak VO<sub>2</sub> were heterogeneous and inversely related to baseline values We found a strong significant correlation between submaximal oxygen uptake efficiency slope OUES and peak VO<sub>2</sub> r 0.89 p
