

# Positive Feedback Loops

Positive feedback loops are NOT used to maintain homeostasis. Rather, positive feedback loops amplify the signal.

In positive feedback loops, the release of a particular hormone initiates actions that lead to the additional release of that hormone.

Positive feedback is more rare. A few examples include:

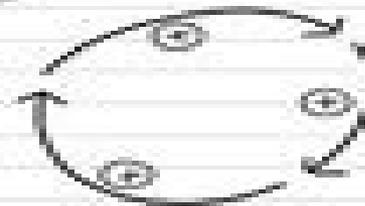

- Childbirth
- Lactation (breastfeeding)
- Fruit ripening (with the hormone ethylene).

## summary:

In **negative feedback**, the hormone feeds back to decrease its own production, helping to maintain stable internal conditions even in changing environments (both internal and external environments).

In **positive feedback**, the hormone increases the production of the same hormone, amplifying the response.
