    Emerging VLSI Devices, Circuits and Architectures Anu Gupta,Jai Gopal Pandey,Nitin Chaturvedi,Devesh Dwivedi,2024-10-18 This book constitutes the proceedings of the 27th International Symposium on VLSI Design and Test VDAT 2023 The 32 regular papers and 16 short papers presented in this book are carefully reviewed and selected from 220 submissions They are organized in topical sections as follows Low Power Integrated Circuits and Devices FPGA Based Design and Embedded Systems Memory Computing and Processor Design CAD for VLSI Emerging Integrated Circuits and Systems VLSI Testing and Security and System Level Design   *Radiation Tolerant Nyquist Analog to Digital Converters* Zheyi Li,Laurent Berti,Paul Leroux,2025-09-30 This book presents the detailed design considerations and techniques for radiation tolerant RT Nyquist analog to digital converters ADC It begins with the fundamental radiation effects in space and its consequences in modern CMOS technology Next radiation effects on ADCs from the transistor level to the architectural level are examined and a detailed design tradeoffs and strategies for radiation tolerant ADCs are described The theory and hardening techniques are supported by measurement data from a high performance RT ADC prototype chip Two important flows which are a technology evaluation flow and an RT IC design flow are also covered in order to give a complete overview on how to achieve an effective RT circuits design   Ultra-Low-Voltage Frequency Synthesizer and Successive-Approximation Analog-to-Digital Converter for Biomedical Applications Chung-Chih Hung,Shih-Hsing Wang,2021-12-07 This book introduces the origin of biomedical signals and the operating principles behind them and introduces the characteristics of common biomedical signals for subsequent signal measurement and judgment Since biomedical signals are captured by wearable devices sensor devices or implanted devices these devices are all battery powered to maintain long working time We hope to reduce their power consumption to extend service life especially for implantable devices because battery replacement can only be done through surgery Therefore we must understand how to design low power integrated circuits Both implantable and in vitro medical signal detectors require two basic components to collect and transmit biomedical signals an analog to digital converter and a frequency synthesizer because these measured biomedical signals are wirelessly transmitted to the relevant receiving unit The core unit of wireless transmission is the frequency synthesizer which provides a wide frequency range and stable frequency to demonstrate the quality and performance of the wireless transmitter Therefore the basic operating principle and model of the frequency synthesizer are introduced We also show design examples and measurement results of a low power low voltage integer N frequency synthesizer for biomedical applications The detection of biomedical signals needs to be converted into digital signals by an analog to digital converter to facilitate subsequent signal processing and recognition Therefore the operating principle of the analog to digital converter is introduced We also show implementation examples and measurement results of low power low voltage analog to digital converters for biomedical applications   *Proceedings of the 2nd International Conference on*

selected monotonic switching scheme was then also modelled in MATLAB to evaluate the efficiency improvement depending on the number of charging steps in that case Stepwise charging requires several intermediate voltage levels in addition to the regular reference voltage The work includes the discussion and implementation of the onboard DC DC converter and the MATLAB model includes its influence on energy savings allowing for a design optimization as well as the selection of the converter s configuration in regards to the number of charging steps resolution and DAC unit capacitor size Finally the work describes a fabricated IC with two proof of concept ADC prototypes featuring 4 step charging applied to a 10 bit monotonic SAR ADC The circuits differ in terms of the DAC capacitance and conversion speed The first prototype has a sampling rate of 165 kS s and achieves SNDR of 57 63 dB The second prototype has a sampling rate of 1 MS s and achieves SNDR of 56 52 dB The architecture is designed with separated circuits for the SAR register and adiabatic charging control logic in order to better differentiate the control logic penalty related to stepwise charging To further identify the power savings in both prototypes the 1 step versions of each prototype with adiabatic circuitry removed from the layout are simulated in CAD and compared to the 4 step counterparts The evaluation of the first prototype shows a 26% reduction of the DAC power consumption including all the extra circuitry whereas the second prototype establishes the limitation of the approach where the energy savings were overpowered by the control logic penalty and DC DC converter switching losses The work discusses this limitation in detail describing the applicability area of adiabatic charging The proposed method allows the inclusion of these types of losses to optimize the configuration and estimate the benefits of the adiabatic switching in each case

Strategies for Reduced-code Static Testing of SAR ADCs Renato Silveira Feitoza,2021 Characterizing the static linearity performance is one of the key tasks in the test of an Analog to Digital converter ADC Normally the static linearity performance figures are measured during the production phase and the standard methodologies in the industry require the collection of a large amount of data since each code needs to be measured a few times to average the effect of noise Reduced code techniques for ADC static linearity test have the potential to drastically reduce the number of necessary measurements for a complete static linearity characterization These techniques take advantage of the repetitive operation of certain families of converters such as pipeline successive approximation registers SARs cyclic etc In this thesis novel reduced code techniques for static linearity test of SAR ADCs are presented They are based on the on chip generation and measurement of the transitions of the internal digital to analog converter DAC of the ADC This allows inferring the complete transfer function of the ADC by measuring only a carefully selected subset of the total set of codes greatly reducing the global test time Moreover the inherent simplification of static linearity tests provided by reduced code techniques may open the door to a full built in self test BIST implementation This way tester requirements can be relaxed and test cost may be further contained by moving static linearity test resources to the device under test itself The proposed test methodology does not require a test stimulus and it is shown that the necessary measurements can be easily extracted by reconfiguring portions of the SAR into a
