Code Structure

```
var ...
//Global variable declarations
function funcA([param1,param2,...])
{
 var ...
 //Local variable declarations – visible in nested functions

 [function innerFuncA([param1,param2...])
 {
  var ...
  //Variables local to innerFuncA
  //your code here
 }]

aName='ExplainThat!';
//implicit global variable creation
//your code here
}
```

Nomenclature Rules

Function and variable names can consist of any alphanumeric character. $ and _ are allowed. The first character cannot be numeric. Many extended ASCII characters are allowed. There is no practical limit on name length. Names are case-sensitive.

If two or more variables or functions or a variable & a function are declared with the same name the last declaration obliterates all previous ones. Using a keyword as a variable or function name obliterates that keyword.

Visibility & Scope

Assignments without the use of the var keyword result in a new global variable of that name being created.

Variables declared with the var keyword outwith the body of a function are global. Variables declared with the var keyword inside the body of a function are local to that function. Local variables are visible to all nested functions.

Local entities hide globals bearing the same name.

Variable Types

string: var s = 'explainthat' or "explainthat"

number: var n = 3.14159, 100, 0...

boolean: var **flag** = false or true

object: var **d** = new Date();

function: var **Greet** = function sayHello() {alert('Hello')}

JavaScript is a weakly typed language – i.e. a simple assignment is sufficient to change the variable type. The **typeof** keyword can be used to check the current variable type.

Special Values

The special values **false**, **Infinity**, **NaN**, **null**, **true** & **undefined** are recognized. **null** is an object. **Infinity** and **NaN** are numbers.
