Shenandoah Sue Eisenfeld, 2015-02 For fifteen years Sue Eisenfeld hiked in Shenandoah National Park in the Virginia Blue Ridge Mountains unaware of the tragic history behind the creation of the park In this travel narrative she tells the story of her on the ground discovery of the relics and memories a few thousand mountain residents left behind when the government used eminent domain to kick the people off their land to create the park With historic maps and notes from hikers who explored before her Eisenfeld and her husband hike backpack and bushwhack the hills and the hollows of this beloved but misbegotten place searching for stories Descendants recount memories of their ancestors grieving themselves to death and they continue to speak of their people's displacement from the land as an untold national tragedy Shenandoah A Story of Conservation and Betrayal is Eisenfeld's personal journey into the park's hidden past based on her off trail explorations She describes the turmoil of residents removal as well as the human face of the government officials behind the formation of the park In this conflict between conservation for the benefit of a nation and private land ownership she explores her own complicated personal relationship with the park a relationship she would not have without the heartbreak of the thousands of people removed from their homes

Principles and Practice of Palliative Care and Supportive Oncology Ann M. Berger, John L. Shuster, Jr., Jamie H. Physics and Necessity Olivier Darrigol, 2014-05-22 Can we prove the necessity of our best physical theories by rational means without appeal to experience This book recounts a few ingenious attempts to derive physical theories by reason only beginning with Descartes geometric construction of the world and finishing with recent derivations of quantum mechanics from natural axioms Deductions based on theological metaphysical or transcendental arguments are worth remembering for the ways they motivated and structured physical theory even though we would now criticize their excessive confidence in the power of the mind Other deductions more modestly relied on criteria for the comprehensibility of nature including forms of measurability causality homogeneity and correspondence The central thesis of this book is that such criteria when properly applied to idealized systems effectively determine some of our most important theories as well as the mathematical character of the laws of physics The relevant arguments are not purely rational because only experience can tell us to which extent nature is comprehensible in a given way Nor do they block the possibility of ever more varied forms of comprehensibility They nonetheless suggest the inevitability of much of our theoretical physics
