[Sponge Iron Production By Direct Reduction Of Iron Oxide](#) CHATTERJEE, AMIT, 2010 This book provides a fascinating study of the very important emerging field of direct reduction in which iron ore is directly reduced in the solid state using either natural gas or non coking coal to produce a highly metallised material referred to as sponge iron or direct reduced iron This intermediate product is subsequently melted

in electric arc furnaces or induction furnaces sometimes even in basic oxygen furnaces to produce liquid steel Such a process combination enables steel to be produced without using coking coal which is an expensive input in the normal blast furnace basic oxygen furnace route of steelmaking adopted in integrated steel plants The book offers comprehensive coverage and critical assessment of various coal based and gas based direct reduction processes Besides dealing with the application of the theoretical principles involved in the thermodynamics and kinetics of direct reduction the book also contains some worked out examples on sponge iron production The concluding part of this seminal book summarises the present and future scenario of direct reduction including the use of gas generated from coal in direct reduction processes The book is primarily intended for the undergraduate and postgraduate students of metallurgical engineering It is also a must read for researchers technologists and process metallurgists engaged in the rapidly developing field of direct reduction of iron oxides which is of critical importance for India and other developing nations that are beginning to play a major role in global steelmaking

Electric Arc Furnace: Methods to Decrease Energy Consumption Alberto N. Conejo,2024-10-15 The Electric Arc Furnace EAF will become the largest producer of steel worldwide replacing the conventional route through the blast furnace and BOF In most developed countries the EAF process is already the main steelmaking reactor This is due to many advantages such as much lower emissions of CO₂ higher flexibility in furnace capacity and higher flexibility in the raw materials such as scrap direct reduced iron DRI and pig iron The EAF process has also experienced a larger level of automation that provides a higher productivity However the EAF process also has a large number of limitations in comparison with the BOF for example 1 use of an expensive type of energy electric energy 2 very poor stirring conditions which results in lower decarburization rates 3 residual elements in steel scrap 4 cost of scrap can be higher than iron ore 5 dependance on DRI to produce higher quality steels 6 higher heat losses 7 lower metallic yield slag leaves the furnace losing iron and heat If the EAF process overcomes these limitations it will be able to fully overcome the BF BOF route and become the dominant process for steelmaking in the 21st century This book discusses in detail 15 methods to decrease energy consumption in the EAF Decreasing energy consumption requires an integral approach which means that all methods should be fully understood and optimized *Source Journals in Metals & Materials* ,1997 Iron and Steel Engineer ,1993
