**Solution of Partial Differential Equations on Vector and Parallel Computers** James M. Ortega, Robert G. Voigt, 1985-01-01 This volume reviews in the context of partial differential equations algorithm development that has been specifically aimed at computers that exhibit some form of parallelism Emphasis is on the solution of PDEs because these are typically the problems that generate high computational demands The authors discuss architectural features of these computers inasmuch as they influence algorithm performance and provide insight into algorithm characteristics that allow effective use of hardware

*Supercomputer Architecture* Paul B. Schneck, 2012-12-06

Supercomputers are the largest and fastest computers available at any point in time The term was used for the first time in the New York World March 1920 to describe new statistical machines with the mental power of 100 skilled mathematicians in solving even highly complex algebraic problems Invented by Mendenhall and Warren these machines were used at Columbia University's Statistical Bureau Recently supercomputers have been used primarily to solve large scale problems in science and engineering Solutions of systems of partial differential equations such as those found in nuclear physics meteorology and computational fluid dynamics account for the majority of supercomputer use today The early computers such as EDVAC SSEC 701 and UNIVAC demonstrated the feasibility of building fast electronic computing machines which could become commercial products The next generation of computers focused on attaining the highest possible computational speeds This book discusses the architectural approaches used to yield significantly higher computing speeds while preserving the conventional von Neumann machine organization Chapters 2-4 Subsequent improvements depended on developing a new generation of computers employing a new model of computation single instruction multiple data SIMD processors Chapters 5-7 Later machines refined SIMD architecture and technology Chapters 8-9 SUPERCOMPUTER ARCHITECTURE CHAPTER INTRODUCTION THREE ERAS OF SUPERCOMPUTERS Supercomputers the largest and fastest computers available at any point in time have been the products of complex interplay among technological architectural and algorithmic developments

**Research Directions in Computer Architecture** Massachusetts Institute of Technology. Laboratory for Computer Science, Jack Bonnell Dennis, 1978 The architecture of a computer system defines the interface that the hardware presents to the software of the system and determines how this interface is realized by subunits of the computer system In the early days of the stored program computer knowledge of logic design the technology of logic and memory devices elementary machine language programming techniques and a good measure of common sense were all that was required to be a computer architect Now things have changed Our concept of what we expect a computer system to do has reached a high degree of sophistication large data bases multiple concurrent processes and programming languages that offer recursive programming abstract data types protection and access control These expectations have been met by

elaborate software systems operating systems data management systems and runtime support for language implementations The ability of system designers to meet these expectations and the quality of the facilities they can provide to the application programmer are critically dependent on properties of mechanisms built into the hardware Thus it has become essential that contemporary computer architects be aware of how architectural decisions interact with software quality how hardware structures can more effectively meet the needs of operating systems and modern concepts or program and data structure
