Generalized Kinetic Models in Applied Sciences Luisa Arlotti, 2003

Mathematical Modeling of Complex Biological Systems Abdelghani Bellouquid, Marcello Delitala, 2007-10-10

Contents and Scientific Aims The scientific community is aware that the great scientific revolution of this century will be the mathematical formalization by methods of applied mathematics of complex biological systems. A fascinating prospect is that biological sciences will finally be supported by rigorous investigation methods and tools similar to what happened in the past two centuries in the case of mechanical and physical sciences. It is not an easy task considering that new mathematical methods may be needed to deal with the inner complexity of biological systems which exhibit features and behaviors very different from those of inert matter. Microscopic entities in biology, say cells in a multicellular system, are characterized by biological functions and the ability to organize their dynamics and interactions with other cells. Indeed, cells organize their dynamics according to the above functions while classical particles follow deterministic laws of Newtonian mechanics. Cells have a life according to a cell cycle which ends up with a programmed death. The dialogue among cells can modify their behavior. The activity of cells includes proliferation and/or destructive events which may in some cases result in dangerously reproductive events. Finally, a cellular system may move far from equilibrium in physical situations where classical particles generally show a tendency toward equilibrium. An additional source of complexity is that biological systems always need a multiscale approach. Specifically, the dynamics of a cell, including its life, are ruled by sub-cellular entities while most of the phenomena can be effectively observed only at the macroscopic scale.

Modeling in Applied Sciences Nicola Bellomo, 2000-04-20

Modeling complex biological, chemical, and physical systems in the context of spatially heterogeneous mediums is a challenging task for scientists and engineers using traditional methods of analysis. Modeling in Applied Sciences is a comprehensive survey of modeling large systems using kinetic equations and, in particular, the Boltzmann equation and its generalizations. An interdisciplinary group of leading authorities carefully develop the foundations of kinetic models and discuss the connections and interactions between model theories, qualitative and computational analysis, and real-world applications. This book provides a thoroughly accessible and lucid overview of the different aspects: models, computations, and methodology for the kinetic theory modeling process. Topics and Features: Integrated modeling perspective utilized in all chapters; Fluid dynamics of reacting gases; Self-contained introduction to kinetic models; Becker-Deuring equations; Nonlinear kinetic models with chemical reactions; Kinetic traffic flow models; Models of granular media; Large communication networks; Thorough discussion of numerical simulations of Boltzmann equation. This new book is an essential resource for all scientists and engineers who use large-scale computations for studying the dynamics of complex systems of fluids and particles. Professionals, researchers, and postgraduates will find the book a modern and authoritative guide to the topic.

Generalized Kinetic Models in Applied Sciences Luisa Arlotti, 2003

This book deals with analytic problems related to some developments and

generalizations of the Boltzmann equation toward the modeling and qualitative analysis of large systems that are of interest in applied sciences These generalizations are documented in the various surveys edited by Bellomo and Pulvirenti with reference to models of granular media traffic flow mathematical biology communication networks and coagulation models The first generalization dealt with refers to the averaged Boltzmann equation which is obtained by suitable averaging of the distribution function of the field particles into the action domain of the test particle This model is further developed to describe equations with dissipative collisions and a class of models that are of interest in mathematical biology In this latter case the state of the particles is defined not only by a mechanical variable but also by a biological microscopic state
