zbMATH In computer science an algorithm is an unambiguous specification of how to solve a class of problems Algorithms can perform calculation data processing and automated reasoning tasks As an effective method an algorithm can be expressed within a finite amount of space and time and in a well defined formal language for calculating a function Starting from an initial state and initial input perhaps empty the instructions describe a computation that when executed proceeds through a finite number of well defined successive states eventually producing output and terminating at a final ending state The transition from one state to the next is not

necessarily deterministic some algorithms known as randomized algorithms incorporate random input This book introduces a set of concepts in solving problems computationally such as Growth of Functions Backtracking Divide and Conquer Greedy Algorithms Dynamic Programming Elementary Graph Algorithms Minimal Spanning Tree Single Source Shortest Paths All Pairs Shortest Paths Flow Networks Polynomial Multiplication to ways of solving NP Complete Problems supported with comprehensive and detailed problems and solutions making it an ideal resource to those studying computer science computer engineering and information technology Introduction to the Design & Analysis of Algorithms Anany Levitin,2012 Based on a new classification of algorithm design techniques and a clear delineation of analysis methods Introduction to the Design and Analysis of Algorithms presents the subject in a coherent and innovative manner Written in a student friendly style the book emphasizes the understanding of ideas over excessively formal treatment while thoroughly covering the material required in an introductory algorithms course Popular puzzles are used to motivate students interest and strengthen their skills in algorithmic problem solving Other learning enhancement features include chapter summaries hints to the exercises and a detailed solution manual
