## Abstract

During the past decade, solving complex optimization problems with metaheuristic algorithms has received considerable attention among practitioners and researchers. Hence, many metaheuristic algorithms have been developed over the last years. Many of these algorithms are inspired by various phenomena of nature. In this paper, a new population based algorithm, the Lion Optimization Algorithm (LOA), is introduced. Special lifestyle of lions and their cooperation characteristics has been the basic motivation for development of this optimization algorithm. Some benchmark problems are selected from the literature, and the solution of the proposed algorithm has been compared with those of some well-known and newest meta-heuristics for these problems. The obtained results confirm the high performance of the proposed algorithm in comparison to the other algorithms used in this paper.

## 1. Introduction

Many engineering optimization problems are usually quite difficult to solve, and many applications have to deal with these complex problems. In these problems, search space grows exponentially with the problem size. Therefore, the traditional optimization methods do not provide a suitable solution for them. Hence, over the past few decades, many meta-heuristic algorithms have been designed to solve such problems. Researchers have shown good performance of meta-heuristic algorithms in a wide range of complex problems such as scheduling problems [1–6], data clustering [7,8], image and video processing [9–12], tuning of neural networks [13–15] and pattern recognition [16–18], etc.

For many years, human have utilized the guidance of nature in finding the most appropriate solution for problems. Hence, during the last decades, there has been a growing attempt in developing algorithms inspired by nature [19–21]. For example, Genetic algorithm was proposed by Holland [22], and

simulates Darwinian evolution concepts. Artificial Immune Systems [23], simulate biological immune systems for optimization. Ant Colony Optimization [24] was inspired by behavior of ants foraging for food. Particle Swarms Optimization [25] mimics the social behavior of a flock of migrating birds trying to reach an unknown destination. Marriage in Honey Bee Optimization Algorithm (MBO) was proposed by Abbas [26], and mimics processes of reproduction in the honey bee colony. Bacterial Foraging Algorithm [27] simulates search and optimal foraging of bacteria. The Shuffled Frog Leaping algorithm [28] was inspired by a frog population searching for food. The Cat Swarm algorithm [29] was developed based on the behavior of cats. Invasive weed optimization was proposed by Mehrabian and Lucas [30], and mimics the ecological behavior of colonizing weeds. Monkey Search [31] simulates a monkey in search for food resources. Water flow-like algorithm [32] was inspired by water flowing from higher to lower levels. Biogeography-based optimization algorithm was introduced by Simon [33], and inspired by biogeography which refers to the study of biological organisms in terms of geographical distribution (over time and space). The Fish

Nature Inspired Metaheuristic Optimization Algorithms and Applications Samuel Gaxiola, 2020 Regarding optimization methods there is much inspiration to be found in nature and biology There has been much effort in recent years to further and develop new methods and algorithms for approaching optimization problems with the inspiration for the logic for these algorithms coming from biology and nature in general Broadly speaking there are three categories of algorithms with respect to the logical structures Swarm intelligence algorithms operate with a logic that utilizes multiple instances in the search space to find an optimal solution by emulating the way lifeforms search for food or

shelter in swarms Evolutionary algorithms operate in such a way that an initial set of instances referred to as the initial population will have certain characteristics used to measure fitness which are then passed on to the subsequent offspring instances in each iteration of the algorithm until some predetermined stop condition is met Population based stochastic algorithms utilize an element of randomness when creating instances and analyzing the search space which make the logic less susceptible to converging to an undesirable solution Because these categories are so broad in their definitions and characteristics there are many algorithms that fall within multiple categories In this work three algorithms are analyzed and characterized The Invasive Weed Optimization IWO algorithm utilizes the concept of unwanted weeds in a garden spreading and serves as the basis for a population based stochastic algorithm The Imperialist Competitive Algorithm ICA emulates the observed relationships between imperialist and colony states in history and utilizes a logic that encapsulates some features of evolutionary algorithms while also being stochastic and population based A hybrid algorithm comprised of population based stochastic characteristics taken from the IWO and swarm intelligence from the Particle Swarm Optimization PSO algorithm provides a more comprehensive and robust method of traversing the search space benefiting from the strengths of both algorithms These algorithms were characterized using benchmark test functions They were then applied to an antenna pattern optimization problem and comparisons between performances were analyzed This work outlines the individual strengths and weaknesses of each algorithm while demonstrating that they outperform the Genetic Algorithm GA with respect to computation time and results for the antenna optimization problem
