

Dynamics of a Quadcopter

- Adjacent rotors of a quadcopter must rotate in opposite direction.
- Diagonally opposite rotors must rotate in the same direction, to provide yaw stability.
- Pitch or yaw can be achieved by varying the rotor speeds, i.e., by increasing speeds of two rotors while decreasing speeds of the other two.
- Once the pitch is altered, the lift vector tilts away from the vertical, causing a translational motion.

[Quadcopter Dynamics Analysis in Real Life and Simulation](#) Riccardo Salis, 2020 Helicopters are flying machines equipped with a powerful rotor which pushing air downwards provides the thrust needed to fly One rotor is not enough to guarantee the control of the helicopter because it would be impossible to counter the torque it produces thus leading the fuselage to spin in the opposite direction Many solutions have been carried out in the last century but all requiring a complicated design of the rotors and other mechanisms A quadrotor helicopter quadcopter is a helicopter which has four coplanar rotors typically mounted at the vertices of a X shape body that provide thrust Using this new configuration

it is possible to balance the torques produced by the rotors and control the flight acting just on their rotational speeds avoiding moving parts The main challenge in projecting quadcopters has been controlling six degrees of freedom acting on four independent rotors In the past few years due to the decreasing cost of new microprocessors able to compute highly nonlinear dynamics equations quadcopters are becoming increasingly popular In this thesis I developed a comparison between the performances of a real quadcopter the DJI Tello Edu and its pc simulation using the software Airsim More specifically I got the drone parameters through a series of tests I built a custom version of the simulation software using the previously obtained data I developed the same flight plan for both real and simulation drone and at the end I made a comparison between them The results of this study will be useful in order to develop a Deep Reinforcement Learning method on the simulation drone and then transfer it on the real one

Rotor Dynamics and Control Applications in a 6 Degree of Freedom Twist-Tilt Quadcopter Abdulaziz M A A Alawadhi, 2022 One of the biggest shortcomings of traditional quadcopters is that they are underactuated with control over only 4 out of a possible 6 degrees of freedom The user may control translations in all three axes as well as a single rotation in the Z axis otherwise known as yaw A handful of designs have been introduced in the field to gain control of the two remaining degrees of freedom as gaining control of them would mean complete control over the quadcopter's attitude and position a useful feature in certain applications This work delves deeper into a design introduced in a previous work of an overactuated quadcopter design with twelve system inputs where each arm has 3 control inputs propeller speed a twist angle and a tilt angle A system identification of the quadcopter is completed using an experimental setup that dissects the quadcopter into a modular part a single arm Furthermore a multibody dynamic simulation of the complete quadcopter is created which accounts for the system's mass distribution moments of inertia and low level motor dynamics which were simplified or ignored in previous work In addition to the previously proposed control scheme a new scheme is also introduced which simplifies the system into a 6 input to 6 output system thus creating a more simple and elegant control scheme Both control schemes are tested in simulation and experiment with success

Introduction to Multicopter Design and Control Quan Quan, 2017-06-23 This book is the first textbook specially on multicopter systems in the world It provides a comprehensive overview of multicopter systems rather than focusing on a single method or technique The fifteen chapters are divided into five parts covering the topics of multicopter design modeling state estimation control and decision making It differs from other books in the field in three

major respects it is basic and practical offering self contained content and presenting hands on methods it is comprehensive and systematic and it is timely It is also closely related to the autopilot that users often employ today and provides insights into the code employed As such it offers a valuable resource for anyone interested in multicopters including students teachers researchers and engineers This introductory text is a welcome addition to the literature on multicopter design and control on which the author is an acknowledged authority The book is directed to advanced undergraduate and beginning graduate students in aeronautical and control or electrical engineering as well as to multicopter designers and hobbyists Professor W Murray Wonham University of Toronto This is the single best introduction to multicopter control Clear comprehensive and progressing from basic principles to advanced techniques it s a must read for anyone hoping to learn how to design flying robots Chris Anderson 3D Robotics CEO *Optimal Control for Stabilization of Quadrotor Vehicle Trajectories* ,2019 The use of quadrotor or quadcopter type aerial vehicles has increased greatly in many industries and continues to be expanded Many of the uses for the vehicle involve autonomously following a desired trajectory More specifically there is a need for a control system that automatically executes a predetermined desired trajectory This is often called the trajectory tracking problem and has been solved in a variety of different ways In this thesis an LQR controller with time varying gains is designed that is able to eliminate tracking error by evaluating the linear time varying estimation of the quadcopter dynamics about a predetermined trajectory This is done by obtaining the reference states and inputs in terms of a so called flat output The performance of the LQR is evaluated via numerical simulation of various trajectories To obtain realistic use cases some consideration is paid to the development of trajectories and the feasibility conditions needed to execute the desired trajectories This is then compared to simplified dynamic models and variations of optimal control law for steady state cases It is determined that the performance of a simplified LQR and dynamic model is acceptable for certain classes of the trajectories attempted This control structure is then put onto an AR Drone 2 0 and tested for altitude pitch roll and yaw stability using MATLAB Simulink with embedded coder In doing so comparisons are made between different sensor fusion techniques for attitude estimation from an onboard inertial measurement unit IMU Comparisons between the AR Drone 2 0 performance and the simulation results in altitude control show a possible discrepancy between the dynamic model and the real system The addition of an integrator is used to achieve stable altitude control and correct error This is done without full position and orientation feedback and uses only onboard sensors from the AR Drone 2 0

Multicopter Design and Control Practice Quan Quan,Xunhua Dai,Shuai Wang,2020-04-17 As the sister book to Introduction to Multicopter Design and Control published by Springer in 2017 this book focuses on using a practical process to help readers to deepen their understanding of multicopter design and control Novel tools with tutorials on multicopters are presented which can help readers move from theory to practice Experiments presented in this book employ 1 The most widely used flight platform multicopters as a flight platform 2 The most widely used flight pilot hardware Pixhawk as a control platform

and 3 One of the most widely used programming languages in the field of control engineering MATLAB Simulink as a programming language Based on the current advanced development concept Model Based Design MBD process the three aspects mentioned above are closely linked Each experiment is implemented in MATLAB and Simulink and the numerical simulation test is carried out on a built simulation platform Readers can upload the controller to the Pixhawk autopilot using automatic code generation technology and form a closed loop with a given real time simulator for Hardware In the Loop HIL testing After that the actual flight with the Pixhawk autopilot can be performed This is by far the most complete and clear guide to modern drone fundamentals I've seen It covers every element of these advanced aerial robots and walks through examples and tutorials based on the industry's leading open source software and tools Read this book and you'll be well prepared to work at the leading edge of this exciting new industry Chris Anderson CEO 3DR and Chairman the Linux Foundation's Dronecode Project The development of a multicopter and its applications is very challenging in the robotics area due to the multidomain knowledge involved This book systematically addresses the design simulation and implementation of multicopters with the industrial leading workflow Model Based Design commonly used in the automotive and aero defense industries With this book researchers and engineers can seamlessly apply the concepts workflows and tools in other engineering areas especially robot design and robotics application development Dr Yanliang Zhang Founder of Weston Robot EX product Manager of Robotics System Toolbox at the MathWorks [Effects of Advanced Modeling on High-performance, Multi-rotor Drone Dynamics and Energy Efficiency](#) Samantha Hoang, 2022 This work focuses on using a dynamics based approach to understand the effects of modeling choices on simulation of high performance multi rotor drones carrying heavy suspended payloads Three aspects of the modeling and simulation of multi rotor drones are examined dynamics and system modeling choices energy costs of controllers and gust disturbance modeling First an 18 rotor drone is modeled as a rigid body using a quaternion formulation with the aerodynamics of the rotors blades simulated using HARP_Opt To control the system both a PID and a PD controller are developed using the same proportional and derivative gains The gust disturbance is modeled deterministically as a simple boxcar function with a duration of one second First the dynamics of the system are explored Since these large multi rotor drones are expected to carry heavy payloads the effect of a heavy suspended payload is found through two means Firstly a linear stability analysis reveals that the model only has negative and zero eigenvalues which imply the the system is at least marginally stable However the stability of the nonlinear system cannot be guaranteed because of the zero eigenvalues To determine the stability of the nonlinear system the system with a heavy suspended payload's response to a simple wind disturbance is simulated The system's response reveals that the presence of the heavy suspended payload makes the system's response diverge significantly from the case when there is no heavy suspended payload with as large as several orders of magnitude difference in the responses These results demonstrate that the nonlinear stability of a large multi rotor drone with a suspended payload must be considered when analyzing future

drone designs for stability Next the effect of aerodynamic model choice for the rotors is explored by comparing a lumped blade LB model with a blade element theory BET model The two aerodynamic models are simulated with identical inputs to follow four simple trajectories that involve vertical flight with no rotation as well as vertical flight with roll pitch and yaw rotation The results show a maximum trajectory error of up to 91% in the case of vertical flight with yaw rotation This demonstrates that aerodynamic model choice has a significant effect on simulation results and the BET model needs to be considered despite it being more computationally intensive than the LB model The last portion of the system dynamics explored is the potential for using rotor groupings to reduce the total energy required to fly the drone With 18 rotors there are many ways in which the drone s trajectory can be flown Two different rotor groupings are considered The two groupings are used to fly the drone on almost identical trajectories The resulting energy calculations reveals that the two groupings consistently maintain a 4 5% difference in energy cost for all the different trajectories simulated Second the energy costs of controllers are explored To do this a method is proposed that uses the difference between open loop system and closed loop system energy costs to determine the energy cost of using a control system As a case study this method is then used to objectively compare a PID controller to a PD controller and characterize the energy cost of integral control The resulting simulations reveal that both controllers perform similarly in tracking the desired trajectory with about a 5% average tracking error for low amplitude trajectories and about a 20% tracking error for large amplitude trajectories However the PID controller consistently uses more energy than the open loop system 7 12 5% more while the PD controller uses similar amounts of energy to the open loop system Additional simulations were completed looking at variations on the integral control The resulting plots of energy and tracking error versus integral control gain magnitude demonstrate that there is a trade off between tracking error and energy that needs to be balanced for each application to ensure all tracking and energy specifications are met Finally the necessity of modeling gust disturbances using a stochastic model is evaluated This is done by using a simple deterministic gust disturbance with variable windspeed and angle and varying which rotors are affected by the gust It is found that when all of the rotors are hit by the gust then the drone responds mainly in the vertical direction When half of the rotors are hit by the gust then the drone exhibits about an order of magnitude more motion in the horizontal direction leading to very different overall responses Changes in windspeed and angle also result in inconsistent variations in the final trajectory and energy usage as well This unpredictability of the resulting trajectory and energy consumption shows that the drone s gust response is highly sensitive to changes in wind parameters In addition the drone s sensitivity to system parameter changes is tested by varying the control gains of the system It is found that when the proportional integral and derivative control gains are all varied by the same amount then the drone s trajectory and energy usage vary significantly As the gains are reduced the energy usage compared to the no wind case varies by between 0 69 82 73% In addition when only the integral control is varied the energy varies by 8 88 18 07% relative to the no wind case These results demonstrate that

both trajectory and energy usage are sensitive to changes in the gust parameters which means that for more complicated gust disturbances the drone's response will be even harder to characterize with deterministic models. Therefore, it is necessary to use stochastic gust modeling and simulations to fully characterize how a drone will respond to a random gust disturbance.

Implementation and Comparison of Linearization-based and Backstepping Controllers for Quadcopters Jesús Valle Rodríguez, 2017. In this work, two approaches to the control of a quadcopter are followed. The first approach resorts to linear quadratic control (LQR) techniques and is based on the linearization of the quadcopter dynamics. Motivated by the fact that this linearization results in decoupled dynamics for the longitudinal, lateral, height, and yaw axes, the LQR controllers can be designed separately. Moreover, the controllers for the longitudinal and lateral dynamics exploit the cascaded structure of the model. The second approach resorts to non-linear control and exploits the fact that the full non-linear model of the quadcopter also has a cascaded structure: the torque inputs control the angles, which in turn determine the forces which drive the position states. The approach is based on a widely used non-linear control design technique for cascaded systems known as backstepping. Simulations of the two approaches are carried out, and conclusions are drawn on the pros and cons of each approach.
