Preface The increasing use of synthetic polymers in preference to metals and other engineering materials for a wide range of applications has been accompanied by the development and improvement of processes for converting them into useful products Indeed it is often the comparative ease and cheapness with which polymeric materials can be processed that make them attractive choices Because of the relatively complex behaviour of the materials polymer processes may appear to be difficult to understand and analyze quantitatively The purposes of this book are to introduce the reader briefly to the main methods of processing thermoplastic polymers and to examine the principles of flow and heat transfer in some of the more industrially important of these processes Much attention is devoted to the two most widely used methods screw extrusion and injection moulding Quantitative analyses based on mathematical models of the processes are developed in order to aid the understanding of them and to improve both the performance and design of processing equipment In addition to algebraic formulae some worked examples are included to illustrate the use of the results obtained In cases where analytical solutions are not possible methods of numerical solution using digital computers are discussed in some detail and typical results presented
