Brebbia, 2008-06-19 In engineering design and development reliable and accurate computational methods are requested to replace or complement expensive and time consuming experimental trial and error work Tremendous advancements have been achieved during recent years due to improved numerical solutions of non linear partial differential equations and computer developments to achieve efficient and rapid calculations Nevertheless to further progress in computational methods will require developments in theoretical and predictive procedures both basic and innovative and in applied research Accurate experimental investigations are needed to validate the numerical calculations This book contains the edited versions of the papers presented at the Tenth International Conference on Advanced Computational Methods and Experimental Measurements in Heat Transfer and Mass Transfer held in Maribor Slovenia in July 2008 The objective of this conference series is to provide a forum for presentation and discussion of advanced topics new approaches and application of advanced computational methods and experimental measurements to heat and mass transfer problems The contributed papers are grouped in the following appropriate sections to provide better access for readers Natural and forced convection Heat exchangers Advances in computational methods Heat recovery Heat transfer Modelling and experiments Processing Foods Fernanda A. Sterilization of canned food is a well known technology that has been in practice for many decades Food sterilization has been well studied in a large number of textbooks This book is not about the science of sterilization or food safety but rather about the important interaction between uid mechanics heat transfer and microbial inactivation Such interaction is complex and if ignored would lead to incorrect information not only on food sterility but also on food quality The book is written by engineers for both food engineers and scientists However it may also be of interest to those working in computational uid dynamics CFD It presents an elementary treatment of the principles of heat transfer during thermal sterilization and it contains suf cient material presented at a high level of mathematics A background in the solution of ordinary and partial differential equations is helpful for proper understanding of the main chapters of this book However we have avoided going into a detailed numerical analysis of the nite volume method FVM of solutions used to solve the sets of equations Some familiarity with uid dynamics and heat transfer will also be helpful but not essential Inthisbook
