//Global variable declarations  
function funcA(param1,param2...){  
  ...  
var ...  
  //Local variable declarations - visible in nested  
  functions  
}

var Name = 'ExplainThat!';

}
```

Nomenclature Rules

Function and variable names can consist of any alphanumeric character, \$ and _ are allowed. The first character cannot be numeric. Many standard ASCII characters are allowed. There is no practical limit on name length. Names are case-sensitive.

If two or more variables or functions or a variable & a function are declared with the same name, the last declaration obliterates all previous ones. Using a keyword as a variable or function name obliterates that keyword.

Visibility & Scope

Assignments without the use of the var keyword result in a new global variable of that name being created.

Variables declared with the var keyword, subwith the body of a function are global. Variables declared with the var keyword inside the body of a function are local to that function. Local variables are visible to all nested functions.

Local entities hide globals bearing the same name.

Variable Types

```
string: var s = 'explainthat' or 'explainthat'  
number: var n = 3.14159, 100, 0...  
boolean: var flag = false or true  
object: var d = new Date();  
function: var greet = function sayHello() {alert('Hello!')};  
JavaScript is a weakly typed language - i.e. a simple  
assignment is sufficient to change the variable type. The  
typeof keyword can be used to check the current  
variable type.
```

Special Values

The special values false, infinity, NaN, null, true & undefined are recognized; null is an object. Infinity and NaN are numbers.
