Secured Authentication System for Internet of Things Gowtham Mohan,2024-04-19 Academic Paper from the year 2024 in the subject Computer Sciences Internet of Things IOT grade A Free University of Berlin The National Institute of Engineering Mysore course Ph D language English abstract The key objectives defined in this thesis are given as follows To analyse the different security breaches in the IoT Ecosystem To develop a lightweight cryptographic scheme for secured Authentication in IoT To develop a multilevel security model by using Enhanced Cryptosystem for secured Authentication in IoT To ensure reliable and secure communication and access across multiple co operatively communicating devices in IoT ecosystems ensuring optimal security and authentication system is must Though IoT demands ensuring security and authentication for both device level security and data security under communication Noticeably the device level security addresses attack resilience from any unwanted or unexpected intruder by applying certain authentication variables or key agreement policies However in the last few years the events pertaining to smart card loss attack SCLA Brute Force attack impersonation attack data sniffing attack etc have questioned major at hand security solutions The irony is in the majority of IoT systems the access information or the key agreement information is saved or preserved onto the local memory which often broadens the horizon for data loss or attack In such classical approaches the possibility of SCLA Impersonation and Brute force attack can t be neglected And therefore ensuring both system level access authentication is inevitable In other words strengthening data security in IoT systems is equally significant like device level security and authentication Once system considers both data level security as well as device level authentication system retaining quality of content and hardware efficiency becomes equally inevitable On the other hand maintaining efficacy of the security system with higher

authentication correctness amongst the gateways and communication devices is must It demands a collaborative low cost or lightweight security model to enable security while maintaining IoT expectations like low computation lightweight computation low power consumption better data quality attack resilience and fast in response It can be considered as the key driving force behind this research
