A Comparative Study of Close-loop Tuning Techniques

B. E. Mary Chan, 1987 A comparative study of four closed loop techniques developed this over the last five years for tuning PID type controllers is presented in this paper Second order processes with varied dead time and damping coefficient are

used to test the relative performances of techniques involved Step responses to a load change and the resulting error integrals form the criteria for comparison The results indicate that optimal tuning based on frequency response provides better control Authors abstract *Polynomial Methods for Control Systems Design* Michael J. Grimble, Vladimir Kucera, 2012-12-06 This monograph was motivated by a very successful workshop held before the 3rd IEEE Conference on Decision and Control held at the Buena Vista Hotel lake Buena Vista Florida USA The workshop was held to provide an overview of polynomial system methods in LQG or H and H_∞ optimal control and 2 estimation The speakers at the workshop were chosen to reflect the important contributions polynomial techniques have made to systems theory and also to show the potential benefits which should arise in real applications An introduction to H₂ control theory for continuous time systems is included in chapter 1 Three different approaches are considered covering state space model descriptions Wiener Hopf transfer function methods and finally polynomial equation based transfer function solutions The differences and similarities between the techniques are explored and the different assumptions employed in the solutions are discussed The standard control system description is introduced in this chapter and the use of Hardy spaces for optimization Both control and estimation problems are considered in the context of the standard system description The tutorial chapter concludes with a number of fully worked examples
