Flat Rate Pricing :

Internet Pricing Andrea Graber, 2005 With the development of the Internet from a research network to a commercial and integrated network which must satisfy heterogeneous user demand prices for Internet usage play an important role This study analyzes the pricing of Internet transport services and interconnection It explains why appropriate pricing requires popular flat rates to be abandoned They should be replaced by usage based prices which are load sensitive and take different service qualities into consideration The aim of this work is to give an overview of Internet pricing proposals to classify investigate and evaluate these pricing schemes as well as to elaborate on relations between them Evaluations are based on normative criteria for Internet pricing from the point of view of social welfare and the perspectives of both Internet service providers and users Moreover this book shows what efficient settlement rules look like at the interconnection level Since these interconnection pricing agreements are closely related to retail pricing models the compatibility between them is also analyzed

Pricing Communication Networks Costas Courcoubetis, Richard Weber, 2003-07-25 Traditionally engineers devised communication services without reference to how they should be priced In today's environment pricing is a very complex subject and in practice depends on many parameters of the actual market including amount of traffic architecture of the network technology and cost The challenge is to provide a generic service model which accurately captures aspects such as quality and performance and can be used to derive optimal pricing strategies Recent technology advances combined with the deregulation of the telecommunication market and the proliferation of the internet have created a highly competitive environment for communication service providers Pricing is no longer as simple as picking an appropriate model for a particular contract There is a real need for a book that explains the provision of new services the relation between pricing and resource allocation in networks and the emergence of the internet and how to price it Pricing Communication Networks provides a framework of mathematical models for pricing these multidimensional contracts and includes background in network services and contracts network technology basic economics and pricing strategy It can be used by economists to fill in the gaps in their knowledge of network services and technology and for engineers and operational researchers to gain the background in economics required to price communication services effectively Provides a broad overview of network services and contracts Includes a primer on modern network technology and the economic concepts relevant to pricing and competition Includes discussion of mathematical models of traffic flow to help describe network capability and derive pricing strategies Includes coverage of specialist topics such as regulation multicasting and auctions Illustrated throughout by detailed real examples Suitable for anyone with an understanding of basic calculus and probability Primarily aimed at graduate students researchers and practitioners from electrical engineering computer science economics and operations research Pricing Communication Networks will also appeal to telecoms engineers working in industry

theory These principles call for provisionally pricing each of the firm's outputs at its marginal cost testing to determine whether such rates satisfy a specified budget constraint e.g revenues costs and then suitably modifying the marginal cost rates in order to satisfy the constraint Most commonly the trial rates produce insufficient revenue and then rates must be raised according to the Ramsey rule prices are increased above marginal costs in inverse proportion to the individual price elasticities of demand This paper applies ratemaking theory to the design of rate structures for local telephone calls that efficiently rate the costs of the local network
