Mineral Property Evaluation Richard L. Bullock, Scott Mernitz, 2017-12-01 Everything sums up what must be

considered for a properly documented property evaluation Less than 30% of the projects that are developed in the minerals industry yield the return on investment that was projected from the project feasibility studies The tools described in this handbook will greatly improve the probability of meeting your projections and minimizing project execution capital cost blowout that has become so prevalent in this industry in recent years Mineral Property Evaluation provides guidelines to follow in performing mineral property feasibility and evaluation studies and due diligence and in preparing proper documents for bankable presentations It highlights the need for a consistent systematic methodology in performing evaluation and feasibility work The objective of a feasibility and evaluation study should be to assess the value of the undeveloped or developed mineral property and to convey these findings to the company that is considering applying technical and physical changes to bring the property into production of a mineral product The analysis needs to determine the net present worth returned to the company for investing in these changes and to reach that decision point as early as possible and with the least amount of money spent on the evaluation study All resources are not reserves nor are all minerals an ore The successful conclusion of any property evaluation depends on the development work and conclusions of the project team The handbook has a diverse audience Professionals in the minerals industry that perform mineral property evaluations Companies that have mineral properties and perform mineral property feasibility studies and evaluations or are buying properties based on property evaluation Financial institutions both domestic and overseas that finance or raise capital for the minerals industry Consulting firms and architectural and engineering contractors that utilize mineral property feasibility studies and need standards to follow And probably the most important the mining and geological engineering students and geology and economic geology students that need to learn the standards that they should follow throughout their careers

Environmental Risks and Challenges of Anthropogenic Metals Flows and Cycles E. van der Voet, 2013 A key question that relates to the very broad and intensive use of metals is whether society needs to be concerned about long term supplies of any or many of them This is a many faceted question that cannot be answered quickly or unequivocally To address it the Global Metal Flows Working Group envisions a series of six reports of which this is the third one addressing environmental risks and challenges of anthropogenic metals flows and cycles This report compiled by a group of international experts focuses on the impact of metals on the environment as well as on their life cycle energy use Currently primary metals production is responsible for 7.8% of the total global energy use as well as for severe local environmental impacts The report suggests to apply best available techniques and to increase recycling of metals which not only requires significantly less energy per kg metal produced than primary production but also helps decreasing the overall local impacts of mining However even if recycling rates are increased rising global demand for many metals will remain a huge environmental
