Slatt,2006-11-03 Reservoir characterization as a discipline grew out of the recognition that more oil and gas could be extracted from reservoirs if the geology of the reservoir was understood Prior to that awakening reservoir development and production were the realm of the petroleum engineer In fact geologists of that

time would have felt slighted if asked by corporate management to move from an exciting exploration assignment to a more mundane assignment working with an engineer to improve a reservoir's performance. Slowly reservoir characterization came into its own as a quantitative multidisciplinary endeavor requiring a vast array of skills and knowledge sets. Perhaps the biggest attractor to becoming a reservoir geologist was the advent of fast computing followed by visualization programs and theaters all of which allow young geoscientists to practice their computing skills in a highly technical work environment. Also the discipline grew in parallel with the evolution of data integration and the advent of asset teams in the petroleum industry. Finally reservoir characterization flourished with the quantum improvements that have occurred in geophysical acquisition and processing techniques and that allow geophysicists to image internal reservoir complexities. Proceedings - Offshore Technology Conference, 2000 The State Geologist's Journal, 2000 Final Report California. Legislature. Joint Committee on Water Problems, 1929 *Petroleum Abstracts*, 1997 **DEVELOPMENT OF AN ADVANCED APPROACH FOR NEXT-GENERATION INTEGRATED RESERVOIR CHARACTERIZATION.**, 2005

Accurate high resolution three dimensional 3D reservoir characterization can provide substantial benefits for effective oilfield management. By doing so the predictive reliability of reservoir flow models which are routinely used as the basis for investment decisions involving hundreds of millions of dollars and designed to recover millions of barrels of oil can be significantly improved. Even a small improvement in incremental recovery for high value assets can result in important contributions to bottom line profitability. Today's standard practice for developing a 3D reservoir description is to use seismic inversion techniques. These techniques make use of geostatistics and other stochastic methods to solve the inverse problem i.e. to iteratively construct a likely geologic model and then upscale and compare its acoustic response to that actually observed in the field. This method has several inherent flaws such as 1 The resulting models are highly non unique multiple equiprobable realizations are produced meaning 2 The results define a distribution of possible outcomes the best they can do is quantify the uncertainty inherent in the modeling process and 3 Each realization must be run through a flow simulator and history matched to assess its appropriateness and therefore 4 The method is labor intensive and requires significant time to complete a field study thus it is applied to only a small percentage of oil and gas producing assets. A new approach to achieve this objective was first examined in a Department of Energy DOE study performed by Advanced Resources International ARI in 2000 2001. The goal of that study was to evaluate whether robust relationships between data at vastly different scales of measurement could be established using virtual intelligence VI methods. The proposed workflow required that three specific relationships be established through use of artificial neural networks ANN's core to log log to crosswell seismic and crosswell to surface seismic. One of the key attributes of the approach which should result in the creation of high resolution reservoir characterization with greater accuracy and with less uncertainty than today's methods is the inclusion of borehole seismic such as crosswell and or vertical seismic profiling VSP in the data collection scheme. Borehole seismic fills a critical gap in

the resolution spectrum of reservoir measurements between the well log and surface seismic scales thus establishing important constraints on characterization outcomes The results of that initial study showed that it is in fact feasible to establish the three critical relationships required and that use of data at different scales of measurement to create high resolution reservoir characterization is possible Based on the results of this feasibility study in September 2001 the DOE again through ARI launched a subsequent two year government industry R D project to further develop and demonstrate the technology The goals of this project were to 1 Make improvements to the initial methodology by incorporating additional VI technologies such as clustering using core measurements in place of magnetic resonance image MRI logs and streamlining the workflow among others 2 Demonstrate the approach in an integrated manner at a single field site and validate it via reservoir modeling or other statistical methods
