Development of Machine Learning τ Trigger Algorithms and Search for Higgs Boson Pair Production Jona Motta, 2026-01-01 This book reports the successful optimization of the Compact Muon Solenoid CMS tau trigger algorithm for the Run 3 Phase 1 of the Large Hadron Collider LHC and a completely new and original design of a machine learning based tau triggering algorithm for the High Luminosity LHC or Phase 2. A large proportion of searches at collider experiments relies on datasets collected with a dedicated tau lepton selection algorithm particularly difficult to operate in intense hadronic environments making the work described in this book of prime importance. The second part of the book describes a major and very challenging data analysis aiming to detect Higgs boson pair production. The book summarizes these contributions in clear pedagogical prose while keeping an adequate and coherent balance between the technical and data analysis aspects. Machine learning techniques were used extensively throughout this research therefore special care has been taken to describe their core principles and application in high energy physics as well as potential future developments for sophisticated low latency trigger algorithms and modern signal extraction methods. Search for the Higgs Boson Produced in Association with Top Quarks with the CMS Detector at the LHC Cristina Martin Perez, 2022-02-09 In this work the interaction between the Higgs boson and the top quark is studied with the proton proton collisions at 13 TeV provided by the LHC at the CMS detector at CERN Geneva. At the LHC these particles are produced simultaneously via the associated production of the Higgs boson with one top quark tH process or two top quarks ttH process. Compared to many other possible outcomes of the proton proton interactions these processes are very rare as the top quark and the Higgs boson are the heaviest elementary particles known. Hence identifying them constitutes a significant experimental challenge. A high particle selection efficiency in the CMS detector is therefore crucial. At the core of this selection stands the Level 1 L1 trigger system a system that filters collision events to retain only those with potential interest for physics analysis. The selection of hadronically decaying leptons expected from the Higgs boson decays is especially demanding due to the large background arising from the QCD interactions. The first part of this thesis presents the optimization of the L1 algorithm in Run 2 2016 2018 and Run 3 2022 2024 of the LHC. It includes the development of a novel trigger concept for the High Luminosity LHC foreseen to start in 2027 and to deliver 5 times the current instantaneous luminosity. To this end sophisticated algorithms based on machine learning approaches are used facilitated by the increasingly modern technology and powerful computation of the trigger system. The second part of the work presents the search of the tH and ttH processes with the subsequent decays of the Higgs boson to pairs of lepton W bosons or Z bosons making use of the data recorded during Run 2. The presence of multiple particles in the final state along with the low cross section of the processes makes the search an ideal use case for multivariate discriminants that enhance the selectivity of the signals and reject the overwhelming background contributions. The discriminants presented are built using state of the art machine learning techniques able to capture the

correlations amongst the processes involved as well as the so called Matrix Element Method MEM which combines the theoretical description of the processes with the detector resolution effects The level of sophistication of the methods used along with the unprecedented amount of collision data analyzed result in the most stringent measurements of the tH and ttH cross sections up to date

Data Analysis Techniques for Physical Scientists Claude A. The Quark Structure of Matter Maurice Jacob,1992-11-01 Understanding the quark structure of matter has been one of the most important advances in contemporary physics It has unravelled a new and deeper level of structure in matter and physics at that level reveals a unity and aesthetic simplicity never before attained All forces emerge from a unique invariance principle and each of the basic interactions results from a specific symmetry property Quarks interact among themselves through their colour as now accurately described by quantum chromodynamics This volume brings together eight major review articles by Maurice Jacob a physicist at the forefront of research on the quark structure of matter He has in particular been involved with two research topics in this field The first is the study of hadronic jets which one actually sees instead of quarks because of the opacity of the vacuum to colour The second is the search for quark matter a new form of matter believed to exist at high temperatures when the vacuum should become transparent to colour The papers in this volume provide a comprehensive review of these phenomenological studies on the quark structure of matter and also a fascinating insight into the pace of recent progress in these areas The book comes complete with an original introduction by the author and also contains a pedagogical review on what is a most engrossing and rewarding field of research in physics

Proceedings of The IX International Conference on Hypernuclear and Strange Particle Physics Josef Pochodzalla,Thomas Walcher,2008-06-27 This volume contains the proceedings of the IX International Conference on Hypernuclear and Strange Particle Physics HYP 2006 This conference series is devoted to the progress of our knowledge about strangeness flavor in hadron and nuclear physics Besides the traditional topics such as hadron structure hypernuclear spectroscopy and weak decay of hypernuclei a particular focus of this conference was on the properties of strange mesons and their binding in nuclear systems

includes lecture courses on Particle identification tracking detectors front end electronics and signal processing triggering and data acquisition general considerations confidence intervals as well as calorimetry Soviet Journal of Nuclear Physics ,1995 *Study of Quark Gluon Plasma By Particle Correlations in Heavy Ion Collisions* Li Yi,2016-08-25 This thesis covers several important topics relevant to our understanding of quark gluon plasma It describes measurement of the third order harmonic flow using two particle correlations and isolation of flow and non flow contributions to particle correlations in gold gold collisions The work also investigates long range longitudinal correlations in small systems of deuteron gold collisions The former is related to the hydrodynamic transport properties of the quark gluon plasma created in gold gold collisions The latter pertains to the question whether hydrodynamics is applicable to small systems such as deuteron gold collisions and whether the quark gluon plasma can be formed in those small system collisions The work presented in this thesis was conducted with the STAR experiment at the Relativistic Heavy Ion Collider at Brookhaven National Laboratory where the center of mass energy of both collision systems was a factor of 100 larger than the rest mass of the colliding nuclei The results contained in this thesis are highly relevant to our quest for deeper understanding of quantum chromodynamics The results obtained challenge the interpretation of previous works from several other experiments on small systems and provoke a fresh look at the physics of hydrodynamics and particle correlations pertinent to high energy nuclear collisions
