Biotransport: Principles and Applications Robert J. Roselli, Kenneth R. Diller, 2011-06-10 Introduction to Biotransport Principles is a concise text covering the fundamentals of biotransport including biological applications of fluid heat and mass transport

Encyclopedia Of Medical Robotics, The (In 4 Volumes) ,2018-08-28 The Encyclopedia of Medical Robotics combines contributions in four distinct areas of Medical robotics namely Minimally Invasive Surgical Robotics Micro and Nano Robotics in Medicine Image guided Surgical Procedures and Interventions and Rehabilitation Robotics The volume on Minimally Invasive Surgical Robotics focuses on robotic technologies geared towards challenges and opportunities in minimally invasive surgery and the research design implementation and clinical use of minimally invasive robotic systems The volume on Micro and Nano robotics in Medicine is dedicated to research activities in an area of emerging interdisciplinary technology that is raising new scientific challenges and promising revolutionary advancement in applications such as medicine and biology The size and range of these systems are at or below the micrometer scale and comprise assemblies of micro and nanoscale components The volume on Image guided Surgical Procedures and Interventions focuses primarily on the use of image guidance during surgical procedures and the challenges posed by various imaging environments and how they related to the design and development of robotic systems as well as their clinical applications This volume also has significant contributions from the clinical viewpoint on some of the challenges in the domain of image guided interventions Finally the volume on Rehabilitation Robotics is dedicated to the state of the art of an emerging interdisciplinary field where robotics sensors and feedback are used in novel ways to re learn improve or restore functional movements in humans

Volume 1 Minimally Invasive Surgical Robotics focuses on an area of robotic applications that was established in the late 1990s after the first robotics assisted minimally invasive surgical procedure This area has since received significant attention from industry and researchers The teleoperated and ergonomic features of these robotic systems for minimally invasive surgery MIS have been able to reduce or eliminate most of the drawbacks of conventional laparoscopic MIS Robotics assisted MIS procedures have been conducted on over 3 million patients to date primarily in the areas of urology gynecology and general surgery using the FDA approved da Vinci surgical system The significant commercial and clinical success of the da Vinci system has resulted in substantial research activity in recent years to reduce invasiveness increase dexterity provide additional features such as image guidance and haptic feedback reduce size and cost increase portability and address specific clinical procedures The area of robotic MIS is therefore in a state of rapid growth fueled by new developments in technologies such as continuum robotics smart materials sensing and actuation and haptics and teleoperation An important need arising from the incorporation of robotic technology for surgery is that of training in the appropriate use of the technology and in the assessment of acquired skills This volume covers the topics mentioned above in four sections The first section gives an overview of the evolution and current state the da Vinci system and clinical

perspectives from three groups who use it on a regular basis The second focuses on the research and describes a number of new developments in surgical robotics that are likely to be the basis for the next generation of robotic MIS systems The third deals with two important aspects of surgical robotic systems teleoperation and haptics the sense of touch Technology for implementing the latter in a clinical setting is still very much at the research stage The fourth section focuses on surgical training and skills assessment necessitated by the novelty and complexity of the technologies involved and the need to provide reliable and efficient training and objective assessment in the use of robotic MIS systems In Volume 2 Micro and Nano Robotics in Medicine a brief historical overview of the field of medical nanorobotics as well as the state of the art in the field is presented in the introductory chapter It covers the various types of nanorobotic systems their applications and future directions in this field The volume is divided into three themes related to medical applications The first theme describes the main challenges of microrobotic design for propulsion in vascular media Such nanoscale robotic agents are envisioned to revolutionize medicine by enabling minimally invasive diagnostic and therapeutic procedures To be useful nanorobots must be operated in complex biological fluids and tissues which are often difficult to penetrate In this section a collection of four papers review the potential medical applications of motile nanorobots catalytic based propelling agents biologically inspired microrobots and nanoscale bacteria enabled autonomous drug delivery systems The second theme relates to the use of micro and nanorobots inside the body for drug delivery and surgical applications A collection of six chapters is presented in this segment The first chapter reviews the different robot structures for three different types of surgery namely laparoscopy catheterization and ophthalmic surgery It highlights the progress of surgical microrobotics toward intracorporeally navigated mechanisms for ultra minimally invasive interventions Then the design of different magnetic actuation platforms used in micro and nanorobotics are described An overview of magnetic actuation based control methods for microrobots with eventually biomedical applications is also covered in this segment The third theme discusses the various nanomanipulation strategies that are currently used in biomedicine for cell characterization injection fusion and engineering In vitro 3D cell culture has received increasing attention since it has been discovered to provide a better simulation environment of in vivo cell growth Nowadays the rapid progress of robotic technology paves a new path for the highly controllable and flexible 3D cell assembly One chapter in this segment discusses the applications of micro nano robotic techniques for 3D cell culture using engineering approaches Because cell fusion is important in numerous biological events and applications such as tissue regeneration and cell reprogramming a chapter on robotic tweezers cell manipulation system to achieve precise laser induced cell fusion using optical trapping has been included in this volume Finally the segment ends with a chapter on the use of novel MEMS based characterization of micro scale tissues instead of mechanical characterization for cell lines studies Volume 3 Image guided Surgical Procedures and Interventions focuses on several aspects ranging from understanding the challenges and opportunities in this domain to imaging technologies to image guided robotic systems for clinical applications

The volume includes several contributions in the area of imaging in the areas of X Ray fluoroscopy CT PET MR Imaging Ultrasound imaging and optical coherence tomography Ultrasound based diagnostics and therapeutics as well as ultrasound guided planning and navigation are also included in this volume in addition to multi modal imaging techniques and its applications to surgery and various interventions The application of multi modal imaging and fusion in the area of prostate biopsy is also covered Imaging modality compatible robotic systems sensors and actuator technologies for use in the MRI environment are also included in this work as is the development of the framework incorporating image guided modeling for surgery and intervention Finally there are several chapters in the clinical applications domain covering cochlear implant surgery neurosurgery breast biopsy prostate cancer treatment endovascular interventions neurovascular interventions robotic capsule endoscopy and MRI guided neurosurgical procedures and interventions Volume 4 Rehabilitation Robotics is dedicated to the state of the art of an emerging interdisciplinary field where robotics sensors and feedback are used in novel ways to relearn improve or restore functional movements in humans This volume attempts to cover a number of topics relevant to the field The first section addresses an important activity in our daily lives walking where the neuromuscular system orchestrates the gait posture and balance Conditions such as stroke vestibular deficits or old age impair this important activity Three chapters on robotic training gait rehabilitation and cooperative orthoses describe the current works in the field to address this issue The second section covers the significant advances in and novel designs of soft actuators and wearable systems that have emerged in the area of prosthetic lower limbs and ankles in recent years which offer potential for both rehabilitation and human augmentation These are described in two chapters The next section addresses an important emphasis in the field of medicine today that strives to bring rehabilitation out from the clinic into the home environment so that these medical aids are more readily available to users The current state of the art in this field is described in a chapter The last section focuses on rehab devices for the pediatric population Their impairments are life long and rehabilitation robotics can have an even bigger impact during their lifespan In recent years a number of new developments have been made to promote mobility socialization and rehabilitation among the very young the infants and toddlers These aspects are summarized in two chapters of this volume
