The development of technologies affects the demands of industries at the present time Thus automatic control has played a vital role in the advance of engineering and science In today s industries control of DC motors is a common practice Therefore implementation of DC motor controller is required There are many types of controller that can be used to implement the elegant and effective output One of them is by using a PI controller PI stands for Proportional and Integral Controllers which are designed to eliminate the need for continuous operator attention thus provide automatic control to the system Cruise control in a car and a house thermostat are common examples of how controllers are used to automatically

adjust some variable to hold the measurement or process variable at the set point This project is focusing on implementing PI controller to control speed of a dc motor The overall project is divided into two parts The first part is concern on the simulation using MATLAB simulink where the dc motor is modeled and PI controller is tuned using Ziegler Nichols rules and software tuning The second part is implementing the simulation This part is divided into another two parts Graphical User Interface GUI development and hardware interfacing GUI is built using National Instrument LabVIEW software with implementation of PI controller An oscilloscope also had been build there Hardware interfacing part is built with Mitsumi dc mini motors M31E 1 Series speed sensor and analog to digital converter DAC8032 As the result PI controller is capable to control the speed of dc motor followed the result from simulation

Direction and Speed Control of DC Motor Norfadilah Zulkefli,2012 Direct current motor is an important drive configuration for many applications across a wide range of powers and speeds It have variable characteristics and used extensively in variable speed drives The goals of this project are to control the direction and speed of Direct Current DC motor The Radio Frequency RF modules also used to make this project as a user friendliness to control the interface yet make it more useful This project divided into two part of circuit First circuit is for transmitter and another circuit is for the receiver Pulse Width Modulation PWM technique is used where its signal is generated by PIC 18F4550 The PWM signal will send to the motor driver to vary the voltage supply to the motor in a desired speed The DC Motor driver L293D is used in this project as it is a component that has dual full bridge driver where it also can control the direction of the DC motor A rotary encoder plate is coupled to the end of motor shaft to provide the feedback speed signal to the controller The RF modules used here are NT T10A for transmitter module and CWC 12 for the receiver module Four push buttons are built at the transmitter side as switches to control the speed and direction of DC motor The four switches are interfaced to the RF transmitter module through PIC 18F4550 16 x 2 Liquid Crystal Display LCD Modules is added at receiving side It functions to display the outputs or corresponding action that obtain from the PIC 18F4550 In conclusion the direction and speed of DC motor can be controlled Plus this motor controller can be applied as a basis in roboting system kid s toys and also industrial field

Speed Control of DC Motor by Using Fuzzy Logic Controller Khairul Afiq Zakaria,2012 The automatic control has played a vital role in the advance of engineering and science Nowadays in industries the control of direct current DC motor is a common practice thus the implementation of DC motor of controller speed is important The main purpose of motor speed control is to keep the rotation of the motor at the present speed and to drive a system at the demand speed The DC Series Wound Motor is very popular in industrial application and control systems because of the high torque density high efficiency and small size The main purpose of this project is to control speed of DC Series Wound Motor using four controllers which are PID PI P and Fuzzy Logic Controller FLC Initially all the controllers are developed by using MATLAB simulink model In this project PID PI and P controller are developed and tuned in order to get faster step response and the Fuzzy Logic Controller FLC is design based on the membership function and the rule base The

expectation of this project is the Fuzzy Logic Controller will get the best performance compared to other controllers in terms of settling time T_s rise time T_r peak time T_p and percent overshoot %OS Finally a GUI of these controllers are developed which allow the users to select any controller and change its parameters according to the different conditions under loaded and unloaded scenarios
