Bioprocess engineering or biochemical engineering is a subcomponent of chemical engineering which encompasses designing and developing those processes and equipment that are required for the manufacturing of products from biological materials and sources such as agriculture, pharmaceutical, chemicals, polymers, food, etc. or for the treatment of environmental process for example waste water. The main focus of this book is to highlight the advancements in the field of bioprocess technology and bioreactor design. The book is divided into various chapters briefing all aspects of bioprocess engineering and focusing on the advances in bioprocess engineering. The book summarizes introduction to bioprocess technology and microbiology, isolation and maintenance of microbial strains and sterilization techniques for advanced level students and researchers. Different models depicting kinetics of microbial growth, substrate consumption and product formation are discussed. The applications of enzymes have increased tremendously and therefore understanding their metabolic pathways to increase yields is also briefly discussed. The calculations of mass and energy balances associated with entropy changes and free energy. This book also covers the approaches for handling different types of cell cultures and current advancements in the area of bioprocess strategies for different culture types which scientists and researchers working in the different cell cultures can refer to. The downstream processing of various industrially important products is also a part of this book. Apart from that, the process economics which ensures the feasibility and quality of any biological process is also dealt with as the last section of the book.

**Bioprocess Engineering Principles** Pauline M. Doran, 1995-04-03 The emergence and refinement of techniques in molecular biology has changed our perceptions of medicine agriculture and environmental management Scientific breakthroughs in gene expression protein engineering and cell fusion are being translated by a strengthening biotechnology industry into revolutionary new products and services Many a student has been enticed by the promise of

biotechnology and the excitement of being near the cutting edge of scientific advancement. However, graduates trained in molecular biology and cell manipulation soon realise that these techniques are only part of the picture. Reaping the full benefits of biotechnology requires manufacturing capability involving the large scale processing of biological material. Increasingly, biotechnologists are being employed by companies to work in co-operation with chemical engineers to achieve pragmatic commercial goals. For many years, aspects of biochemistry and molecular genetics have been included in chemical engineering curricula, yet there has been little attempt until recently to teach aspects of engineering applicable to process design to biotechnologists. This textbook is the first to present the principles of bioprocess engineering in a way that is accessible to biological scientists. Other texts on bioprocess engineering currently available assume that the reader already has engineering training. On the other hand, chemical engineering textbooks do not consider examples from bioprocessing and are written almost exclusively with the petroleum and chemical industries in mind. This publication explains process analysis from an engineering point of view but refers exclusively to the treatment of biological systems. Over 170 problems and worked examples encompass a wide range of applications including recombinant cells, plant and animal cell cultures, immobilised catalysts as well as traditional fermentation systems.

First book to present the principles of bioprocess engineering in a way that is accessible to biological scientists. Explains process analysis from an engineering point of view but uses worked examples relating to biological systems. Comprehensive, single-authored, 170 problems and worked examples encompass a wide range of applications involving recombinant plant and animal cell cultures, immobilized catalysts and traditional fermentation systems. 13 chapters organized according to engineering sub-disciplines are grouped in four sections: Introduction, Material and Energy Balances, Physical Processes and Reactions, and Reactors. Each chapter includes a set of problems and exercises for the student, key references, and a list of suggestions for further reading. Includes useful appendices detailing conversion factors, physical and chemical property data, steam tables, mathematical rules, and a list of symbols used. Suitable for course adoption, follows closely curricula used on most bioprocessing and process biotechnology courses at senior undergraduate and graduate levels.
