6.375 Tutorial 5
February 12, 2007

In this tutorial you will gain experience using Cadence Encounter to perform automatic placement and routing. A place+route tool takes a gate-level netlist as input and first determines how each gate should be placed on the chip. It uses several heuristic algorithms to group related gates together and thus hopefully minimize routing congestion and wire delay. Place+route tools will focus their effort on minimizing the delay through the critical path. To this end, these tools can resize gates, insert new buffers, and even perform local resynthesis. Place+route tools often have additional algorithms to help reduce area for non-critical paths. After placement, the place+route tool will attempt to route the design while minimizing wire delay. Place+route tools often include additional facilities for clock tree synthesis, power routing, and block level floorplanning. Figure 1 shows how Encounter fits into the 6.375 toolflow.

The following documentation is located in the course locker (`/mit/6.375/doc`) and provides additional information about Encounter and the Tower 0.18 μm Standard Cell Library.

Getting started

Before using the 6.375 toolflow you must add the course locker and run the course setup script with the following two commands.

```
% add 6.375
% source /mit/6.375/setup.csh
```

For this tutorial we will be using an unpipelined SMIP^{Sv1} processor as our example RTL design. You should create a working directory and checkout the SMIP^{Sv1} example project from the course CVS repository using the following commands.

```
% mkdir tut5
% cd tut5
% cvs checkout examples/smipsv1-1stage-v
% cd examples/smipsv1-1stage-v
```

Before starting, take a look at the subdirectories in the `smipsv1-1stage-v` project directory. Figure 2 shows the system diagram which is implemented by the example code. When pushing designs through the physical toolflow we will often refer to the *core*. The core module contains everything which will be on-chip, while blocks outside the core are assume to be off-chip. For this tutorial we are assuming that the processor and a *combinational memory* are located within the core. A *combinational memory* means that the read address is specified at the beginning of the cycle, and
