## Context

When purchasing items, it is often not clear how much the total price will be after discounts are applied. For example, suppose you are buying a book that costs \$10.00. The store offers a 10% discount on the book. The store also offers a 5% discount on the total price. How much will you pay for the book?

Let  $x$  be the original price of the book. The original price is \$10.00.

Let  $y$  be the amount of the 10% discount. The amount of the 10% discount is \$1.00.

Let  $z$  be the amount of the 5% discount. The amount of the 5% discount is \$0.50.

Let  $w$  be the amount of the total price after discounts. The amount of the total price after discounts is \$8.50.

Let  $v$  be the amount of the total price after discounts. The amount of the total price after discounts is \$8.50.
