Embedded C interview questions and answers related to memory management

Q How would you implement a stack data structure in a memory-constrained embedded system?

A A strong candidate should explain that implementing a stack in a memory-constrained system requires careful consideration of the available resources. They might describe the following approach:

- Allocate a fixed-size array to serve as the stack

- Use a stack pointer to keep track of the top element

- Implement push and pop operations that check for stack overflow and underflow

- Consider using a circular buffer implementation for more efficient memory usage

Look for candidates who emphasize the importance of error handling and boundary checks. They should also be able to discuss trade-offs between stack size and other memory needs in the system.
