- Application signatures
- Decryption
- Protocol decoding
- Heuristics.

The App-ID service can block high risk applications, as well as high risk behaviour, such as file-sharing, and traffic encrypted with the SSL protocol can be decrypted and inspected.

Ques 3. How does App-ID identify the application used in network?

Identification of the applications is the very 1st task performed by Palo Alto Networks NGFW traversing the network using App-ID. Below are the identification mechanisms–

- Application protocol detection and decryption where application protocol is determined and if SSL is in use, decrypts the traffic so that it can be analysed further.
- Application protocol decoding where it determines whether the initially detected application protocol is the actual one, or if it is being used as a tunnel to hide the actual application.
- Application signatures where Context-based signatures look for unique properties and transaction characteristics to correctly identify the application regardless of the port and protocol being used.
- Heuristics is applied for traffic that eludes identification by signature analysis. Heuristics identifies any troublesome applications, such as P2P or VoIP tools that use proprietary encryption.
