Reinforcement Learning By Richard S Sutton:

Reinforcement Learning Richard S. Sutton, 2012-12-06 Reinforcement learning is the learning of a mapping from situations to actions so as to maximize a scalar reward or reinforcement signal. The learner is not told which action to take as in most forms of machine learning but instead must discover which actions yield the highest reward by trying them. In the most interesting and challenging cases actions may affect not only the immediate reward but also the next situation and through that all subsequent rewards. These two characteristics trial and error search and delayed reward are the most important distinguishing features of reinforcement learning. Reinforcement learning is both a new and a very old topic in AI. The term appears to have been coined by Minsky 1961 and independently in control theory by Walz and Fu 1965. The earliest machine learning research now viewed as directly relevant was Samuel's 1959 checker player which used temporal difference learning to manage delayed reward much as it is used today. Of course learning and reinforcement have been studied in psychology for almost a century and that work has had a very strong impact on the AI engineering work. One could in fact consider all of reinforcement learning to be simply the reverse engineering of certain psychological learning processes e.g. operant conditioning and secondary reinforcement. Reinforcement Learning is an edited volume of original research comprising seven invited contributions by leading researchers.

Reinforcement Learning Richard S. Sutton, Andrew G. Barto, 1998 An account of key ideas and algorithms in reinforcement learning. The discussion ranges from the history of the field's intellectual foundations to recent developments and applications. Areas studied include reinforcement learning problems in terms of Markov decision problems and solution methods.

AI 2003: Advances in Artificial Intelligence Tamas D. Gedeon, Lance C.C. Fung, 2003-12-01 Consider the problem of a robot algorithm learning mechanism moving along the real line attempting to locate a particular point. To assist the mechanism we assume that it can communicate with an Environment Oracle which guides it with information regarding the direction in which it should go. If the Environment is deterministic the problem is the Deterministic Point Location Problem which has been studied rather thoroughly. 1 In its pioneering version 1 the problem was presented in the setting that the Environment could charge the robot a cost which was proportional to the distance it was from the point sought for. The question of having multiple communicating robots locate a point on the line has also been studied. 1 2 In the stochastic version of this problem we consider the scenario when the learning mechanism attempts to locate a point in an interval with stochastic i.e. possibly erroneous instead of deterministic responses from the environment. Thus when it should really be moving to the right it may be advised to move to the left and vice versa. Apart from the problem being of importance in its own right the stochastic point location problem also has potential applications involving optimization problems. In many optimization solutions for example in image processing pattern recognition and neural computing. 5 9 11 12 14 16 19 the algorithm works its way from its current solution to the optimal solution based on information that it currently has. A crucial question is one of determining the parameter which the optimization algorithm should use. ECAI 2020
