

SPENT FUSE LINKS

Finding cutouts open, but no signs of trouble on the line, can be frustrating for line personnel. A link removed from an open cutout and visually examined is sometimes categorized as having "pulled apart." In reality, the link may be spent because there was a fault and the link reacted to it. By looking for certain characteristics on activated Chance Type T, K, and Slo-Fast links, you can determine when links have operated and at what general current levels.

FUSE LINK CONSTRUCTION

To analyze the remains of a fuse link, one must first know link construction. Different element materials, strain wires, solder and crimp connections, heater coils and solder junctions are all used in Chance fuse links to control operating speeds. Those performances are shown on published minimum melt and total clear curves (Figure 1).

T LINK CONSTRUCTION

T links, 1 through 3 amps have stainless steel elements mechanically crimped at the buttonhead and cable adapter. The 6 through 100 amp links have a similar construction except the stainless steel wire acts mainly as a load-bearing strain member (Photograph 1).

A USED LINK HAS A STORY TO TELL

Figure 1

Current is carried primarily by a parallel pure tin element which is soldered to the exterior of the buttonhead and cable adapters at the crimps. 140 and 200 amp T links have a heavy copper element which is soldered into the buttonhead at the top and mechanically crimped into the cable adapter at the bottom (Photograph 2).
