

INTRODUCTION TO ASPEN PLUS SIMULATION

What is Process Simulation/Analysis?

The purpose of process simulation is to model and predict the performance of a process. It involves the development of the process into the mathematical elements (e.g. units) and subsequent study of performance. The process identification (e.g. flowsheet, instrumentation, composition, process conditions, equipment sizes, etc.) are predicted using analysis techniques (flow balances, energy balances, material balances) and/or experimental data and/or other information available (e.g. ASPEN Plus). In addition, process analysis may involve the use of sophisticated tools to predict and evaluate performance. Examples of process simulation, not yet given, are process design and diagnosis and are described in the process design (Fig. 1). The tool used here is ASPEN Plus. It is a comprehensive software which uses the underlying physical relationships (e.g., material and energy balances, thermodynamic properties, rate equations to predict process performance (e.g., stream properties, operating conditions, and equipment sizes).

Fig. 1. Process Simulation Problem.

There are several advantages of computer aided simulation:

- Allows the designer to quickly test the performance of complex process structures and provide feedback to the process synthesis activities.
- Can be incorporated with process synthesis to finding optimum integrated designs.
- Minimizes experimental and scale-up efforts.
- Explains process flexibility and sensitivity by answering "what if" questions.
- Quantitatively models the process and checks design for process performance.

Despite these advantages, there are some limitations including the increasing number of complex aided simulation:

- It is hard to quickly test the simplified RST simulation.
- The computational power needed to solve large-scale RST gives the simulation.
- Not all RST simulation products that the simulation model under physical process conditions give with the RST the ability to calculate transient data of the model of great value.
