CORE DRILLING

Core drilling can be considered both a geological and geophysical technique and can be used to determine the true vertical orientation of a horizon. The information and accuracy of the results are the foundation of seismic. Core drilling also provides the location of structural trap potential. Core drills are used frequently to measure aquifer thickness where the existing data is sparse (needed to correct downward time to depth). The two locations are determined and corrected by continuous and intermittent recording of continuous geophysical logging (acoustic and resistivity) versus depth. Logging resistivity data is the most significant tool today because it provides the most accurate data and is available for virtually every horizon.
