Programming the ARM® Cortex®-M4-based STM32F4 Microcontrollers with Simulink® Farzin Asadi, Sawai Pongswatd, 2021-10-18 A microcontroller is a compact integrated circuit designed to govern a specific operation in an embedded system A typical microcontroller includes a processor memory and input output I O peripherals on a single chip When they first became available microcontrollers solely used Assembly language Today the C programming language and some other high level languages can be used as well Some of advanced microcontrollers support another programming technique as well Graphical programming In graphical programming the user does not write any code but draws the block diagram of the system he wants Then a software converts the drawn block diagram into a suitable code for the target device Programming microcontrollers using graphical programming is quite easier than programming in C or Assembly You can implement a complex system within hours with graphical programming while its implementation in C may take months These features make the graphical programming an important option for engineers This book study the graphical programming of STM32F4 high performance microcontrollers

with the aid of Simulink and Waijung blockset Students of engineering for instance electrical biomedical mechatronics and robotic to name a few engineers who work in industry and anyone who want to learn the graphical programming of STM32F4 can benefit from this book Prerequisite for this book is the basic knowledge of MATLAB Simulink
